PROJECT GUIDE · ALPHA DEMO · OCTOBER 2026

CareFusion AI

A unified medical-affairs platform for Indian government health services. Citizens, doctors, hospital staff, pharmacies and administrators all work from one shared, permission-controlled record.

Project guide and user stories, with screenshots from the running demo.

Synthetic data only | Simulated AI output | Mock government connectors

At a glance

12
Roles
Citizen, doctor, nurse, lab, radiology, pharmacist, pharmacy admin, hospital admin and four government levels.

42
Designed screens
All built and running, from the public landing page to the national console.

5
Portals
Public site, Citizen app, Doctor app, Staff Portal and Admin Console.

278
Database rule tests
Automated checks that protect privacy, audit trails and clinical safety rules.

Ground rules of the platform

Synthetic data only
No real patient data is ever used or asked for. Every screen carries a "Synthetic demo data" banner.

No raw Aadhaar anywhere
Only tokens are stored. Demo identifiers can never be mistaken for real ones.

AI is decision support only
Every AI result is simulated, labelled and marked as needing clinician review. Citizens see an AI result only after a doctor has reviewed it.

Patients hold the key
A doctor opens a record only with the patient's rotating key, or by emergency "break-glass" access that is logged and reviewed.

Government services are mocked
Aadhaar e-KYC, face check, ABHA, HPR, HFR, e-Sign and SMS use the same request and response shape as the real services, but are simulated.

Who uses it: twelve roles

Each role has one named person in the demo. Passwords are skipped in the demo.

ROLE	DEMO PERSON	WHAT THEY DO
Citizen	Anjali Menon	Keeps her health record, controls who sees it, books care, tracks medicines, donates blood and organs.
Doctor	Dr. Arun Nair	Opens a patient with their key, reviews AI hints, prescribes, orders tests, handles emergencies.
Nurse	Lekha Pillai	Runs a 24-bed ward: vitals with early-warning scores, medication round, handover.
Lab technician	Rahul Varghese	Receives orders, enters results with reference ranges, calls critical values, runs quality control.
Radiology technician	Fathima Beevi	Works the imaging list, captures studies, tracks rooms and equipment.
Pharmacist	Joseph Mathew	Verifies prescriptions, dispenses earliest-expiry stock first, hands over to the patient.
Pharmacy admin	Suma Thomas	Manages pharmacists, stock, purchase orders, recalls and licence compliance.

ROLE	DEMO PERSON	WHAT THEY DO
Hospital admin	Dr. Meera Krishnan	Approves staff, manages beds, rosters, complaints and reviews emergency access.
District admin	Ajay Kumar	Watches Pathanamthitta: disease trends, approvals, health alerts, blood stock.
State admin	Latha Nair	The same console for the whole of Kerala.
Zonal admin	R. Venkatesh	The same console for the South zone.
Central admin	S. Banerjee	The national view, plus AI governance and platform settings.

How the pieces connect: one demo day

1. **Citizen**
   Anjali books a follow-up with Dr. Nair for Wednesday 21 October.
2. **Doctor**
   The booking appears in Dr. Nair’s schedule. On the day she shows her rotating key and he opens her record for 30 minutes.
3. **Doctor**
   He reviews a simulated AI hint, orders a lipid test and signs a prescription.
4. **Lab**
   Rahul releases the result (LDL 142). Anjali and Dr. Nair are notified.
5. **Pharmacy**
   Joseph verifies the prescription, dispenses the earliest-expiry batch and marks it ready to collect.
6. **Citizen**
   Anjali sees "Ready to collect" in her alerts and medicines page.
7. **Emergency**
   A doctor uses break-glass for an unconscious patient. The hospital admin must review it. Other patients’ names never reach Anjali’s feed.
8. **District**
   Ajay sees leptospirosis rising in two blocks and sends a health alert. He only ever sees counts, never patient names.

How to read the user stories

Each story follows the shape *As a [role], I want [goal], so that [benefit]*, next to a short list of what the screen does today and a screenshot taken from the running demo at a normal 1440 by 900 desktop window. All names, numbers and IDs are synthetic. Real government logos are not used.

GUIDE PAGE 2 · PUBLIC SITE

Public site and sign-in

Everything a visitor sees before they sign in: the landing page, the demo launcher, registration and the separate login doors for staff and administrators.

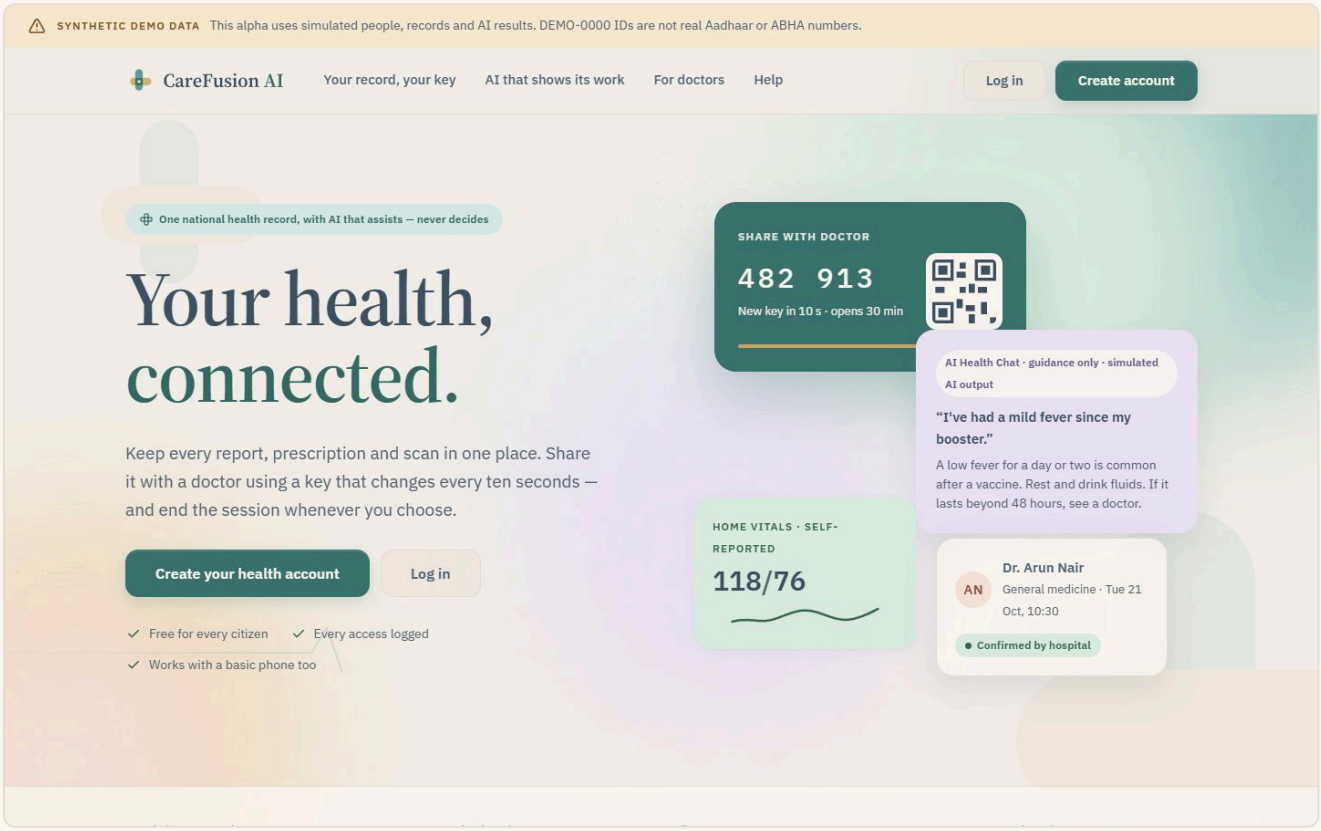

Try it: open /demo-signin in the running app and pick any role. No password is needed in the demo.

PUB-1

Understand the platform and choose a door

As a first-time visitor, **I want** to see what CareFusion AI is for and where to sign in **so that** I reach the right door without guessing.

- Hero line "Your Health, Connected." with a plain explanation of the platform.
- Separate sign-in doors for citizens and doctors, hospital staff, and administrators.
- Registration links for citizens, doctors, hospital admins and pharmacy admins.
- The synthetic-data banner is visible at the very top.

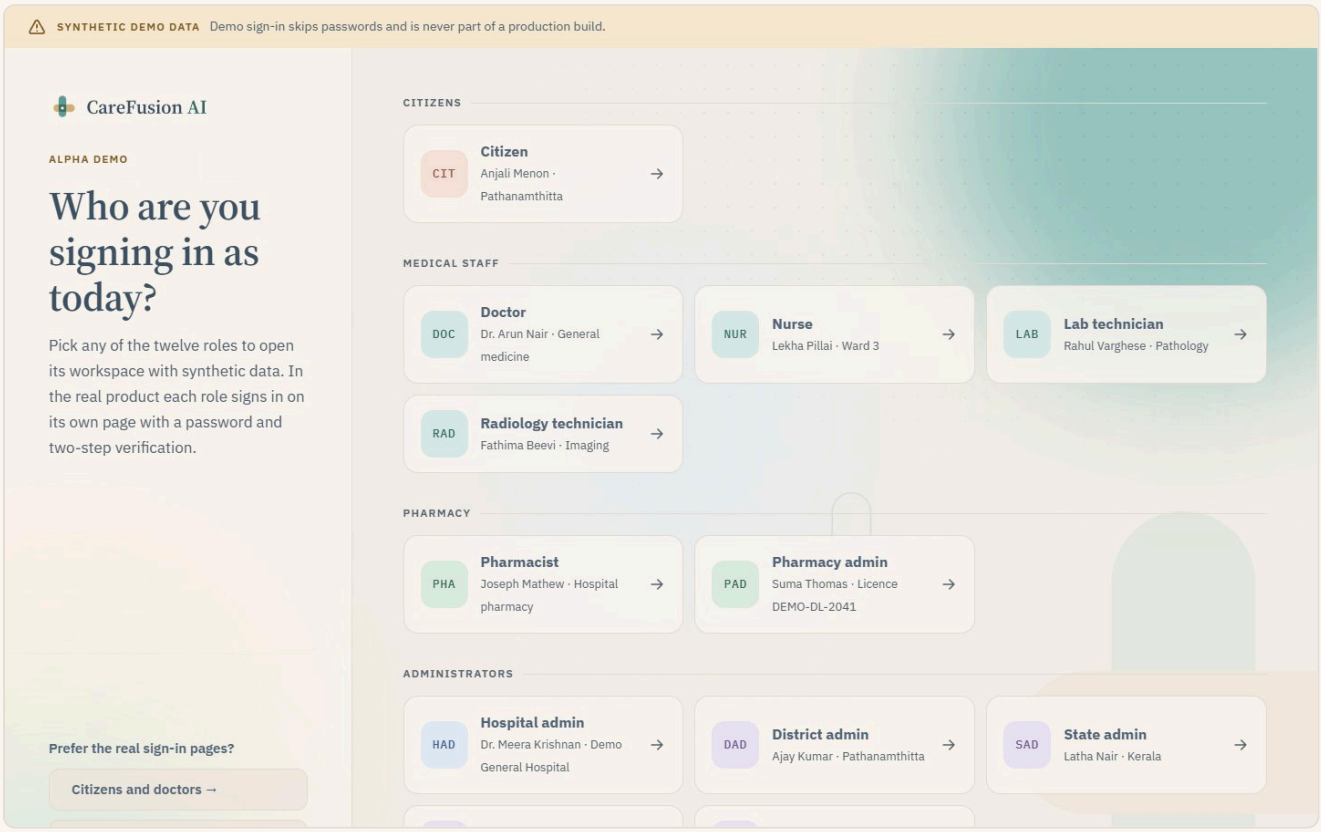

Screenshot of /

PUB-2

Open any role in the demo

As a demo reviewer, **I want** to jump into any of the twelve roles without a password **so that** I can see every workspace in a few minutes.

- One card per role, grouped as Citizens, Medical staff, Pharmacy and Administrators, each with its demo person.
- Links to the real sign-in pages for each audience are on the left.
- Every demo sign-in is written to the audit log as auth.demo_login.
- Never part of a production build.

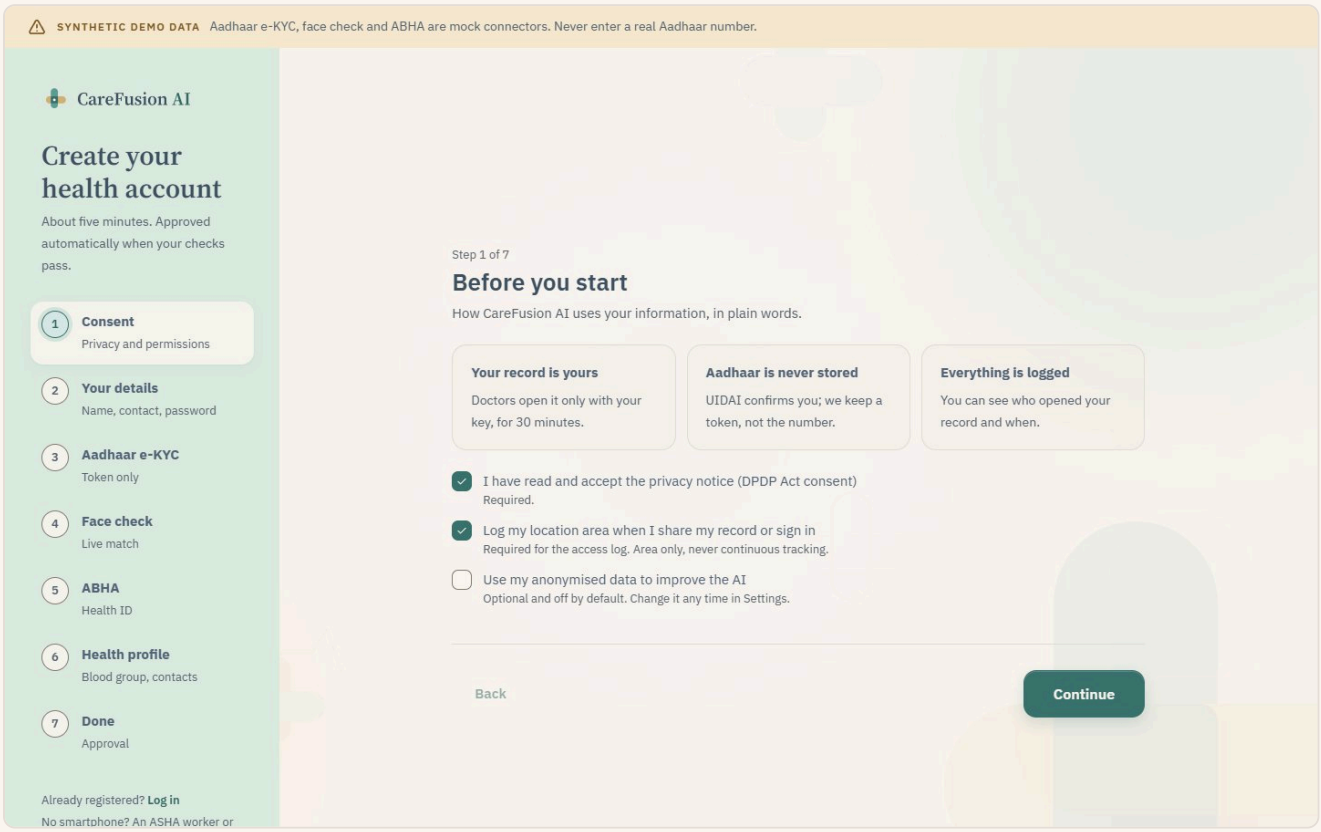

Screenshot of `/demo-signin`

PUB-3

Register as a citizen

As a new citizen, **I want** to register with an Aadhaar OTP, a face check and an ABHA number **so that** I get a verified health account without paperwork.

- A step-by-step flow: identity, OTP, face check, ABHA, contacts and consent.
- The Aadhaar number is cleared after verification. Only a token is kept.
- Runs on mock connectors. In the demo the Aadhaar number starts 0000 and the OTP is 123456.
- The last step shows the new person ID, which doctors and admins use when registering.

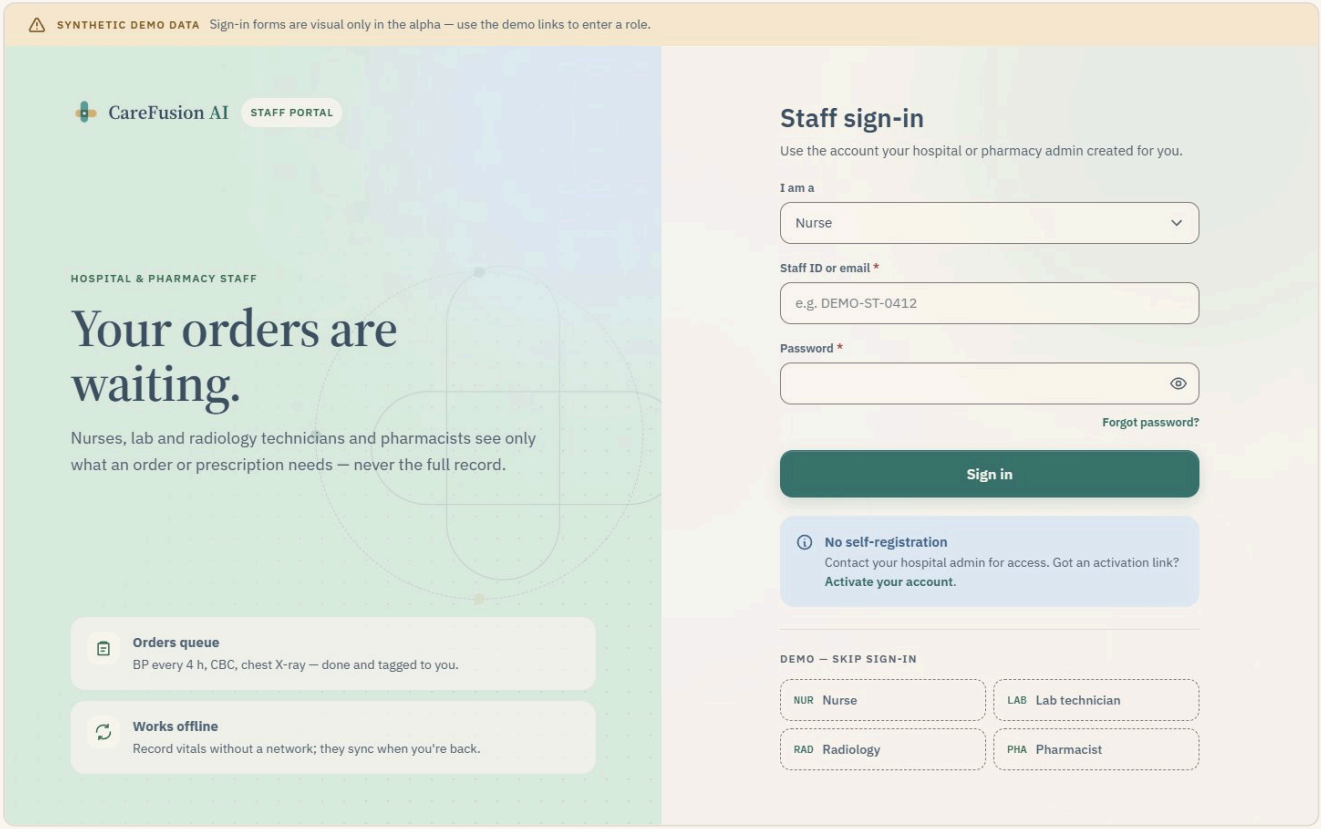

Screenshot of `/register`

PUB-4

A separate door for hospital staff

As a nurse, lab technician or pharmacist, **I want** to sign in on a page made for hospital staff **so that** my work account is kept apart from public logins.

- Accounts are created by the hospital admin or pharmacy admin, never by self-registration.
- First-time activation and recovery pages exist.
- Alpha status: the password and two-step fields are visual only. Staff enter the app through the demo launcher.

Screenshot of `/login/staff`

Citizen app: home, access, records and AI chat

The citizen is the owner of the record. These eight screens cover the home page, who can see the record, the health profile, documents, dates, home readings, the AI health chat and messages with doctors. The demo citizen is Anjali Menon, 35, from Pathanamthitta, who lives with type 2 diabetes.

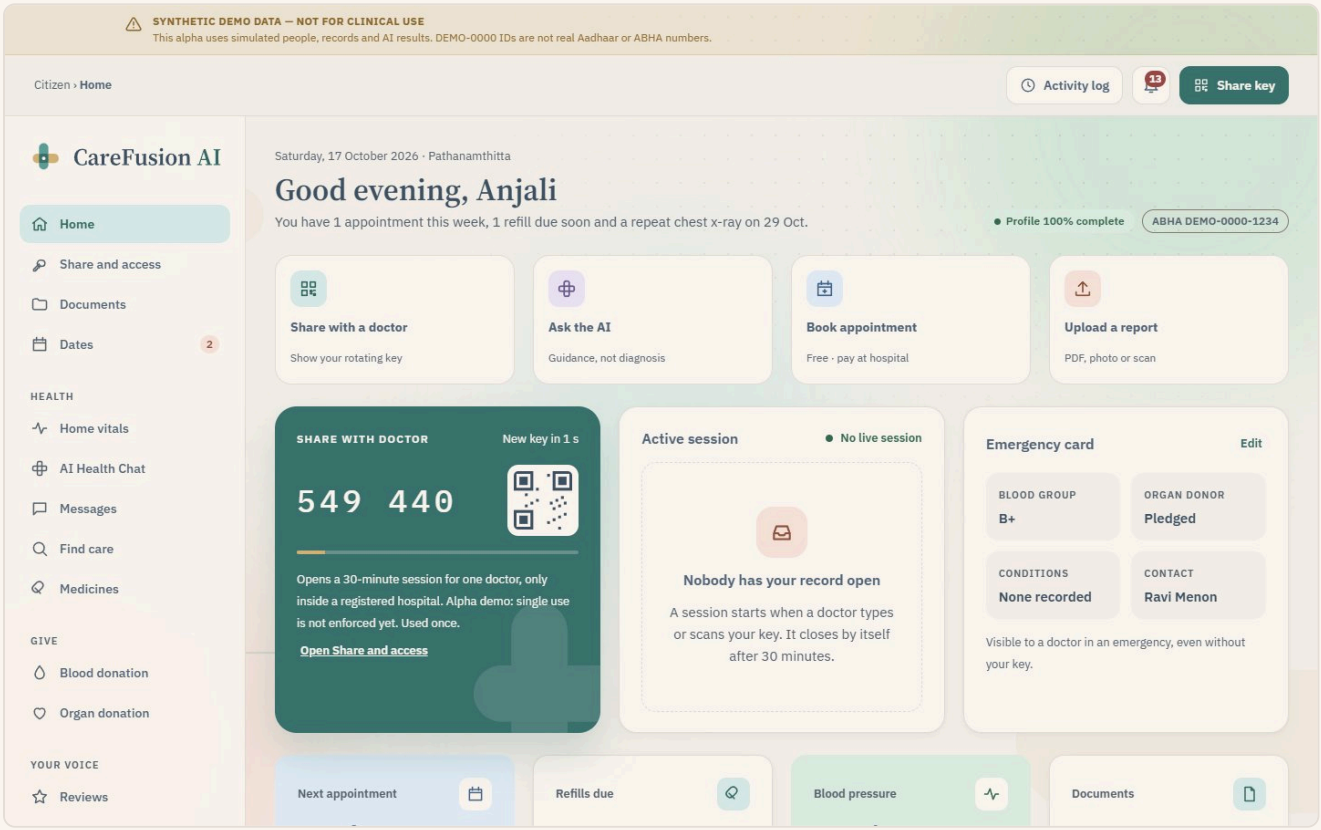

Try it: open /demo-signin and choose Citizen (Anjali Menon).

CIT-1

See my health day at a glance

As a citizen, **I want** a home page that shows my next appointment, refills, blood pressure and alerts **so that** I know what needs my attention today.

- Greeting, date and a profile-complete badge with her demo ABHA number.
- Quick actions: share with a doctor, ask the AI, book an appointment, upload a report.
- Cards for the next appointment (Wed 21 Oct, token 16), refills due, blood pressure with an on-target count, and document count.
- Health alerts, dates to remember and a 30-day blood-pressure chart.

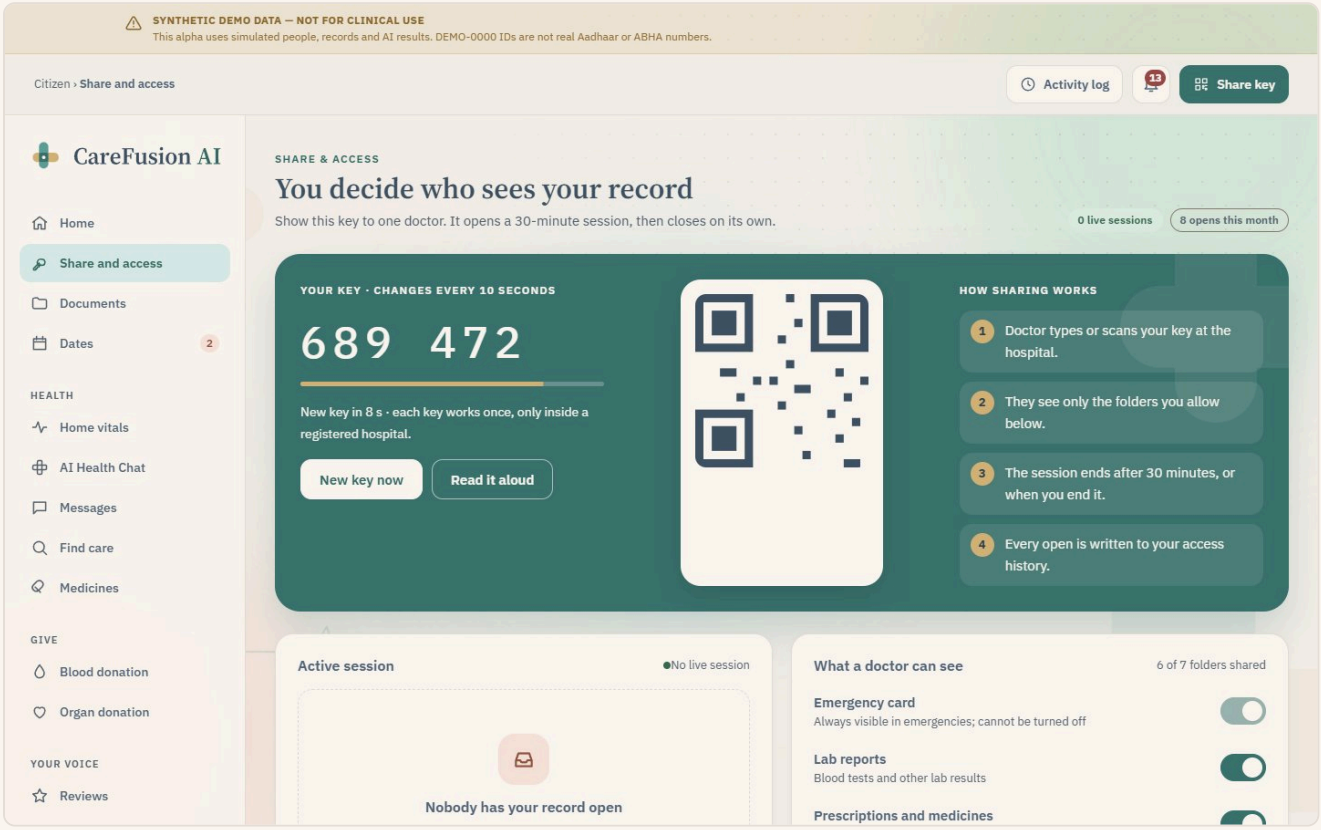

Screenshot of `/citizen`

CIT-2

Let a doctor in, and only for as long as I choose

As a citizen, **I want** a rotating key I can show a doctor, and switches for what they may see **so that** nobody opens my record without my say.

- A 6-digit code and QR that change every few seconds. A doctor types or scans it to open a 30-minute session.
- Live sessions can be ended by me at any time. A full history shows every doctor and staff member who opened the record.
- Category switches for lab, prescriptions, vitals, imaging, genomic and mental-health data.
- Trusted family can be added so a relative can help.

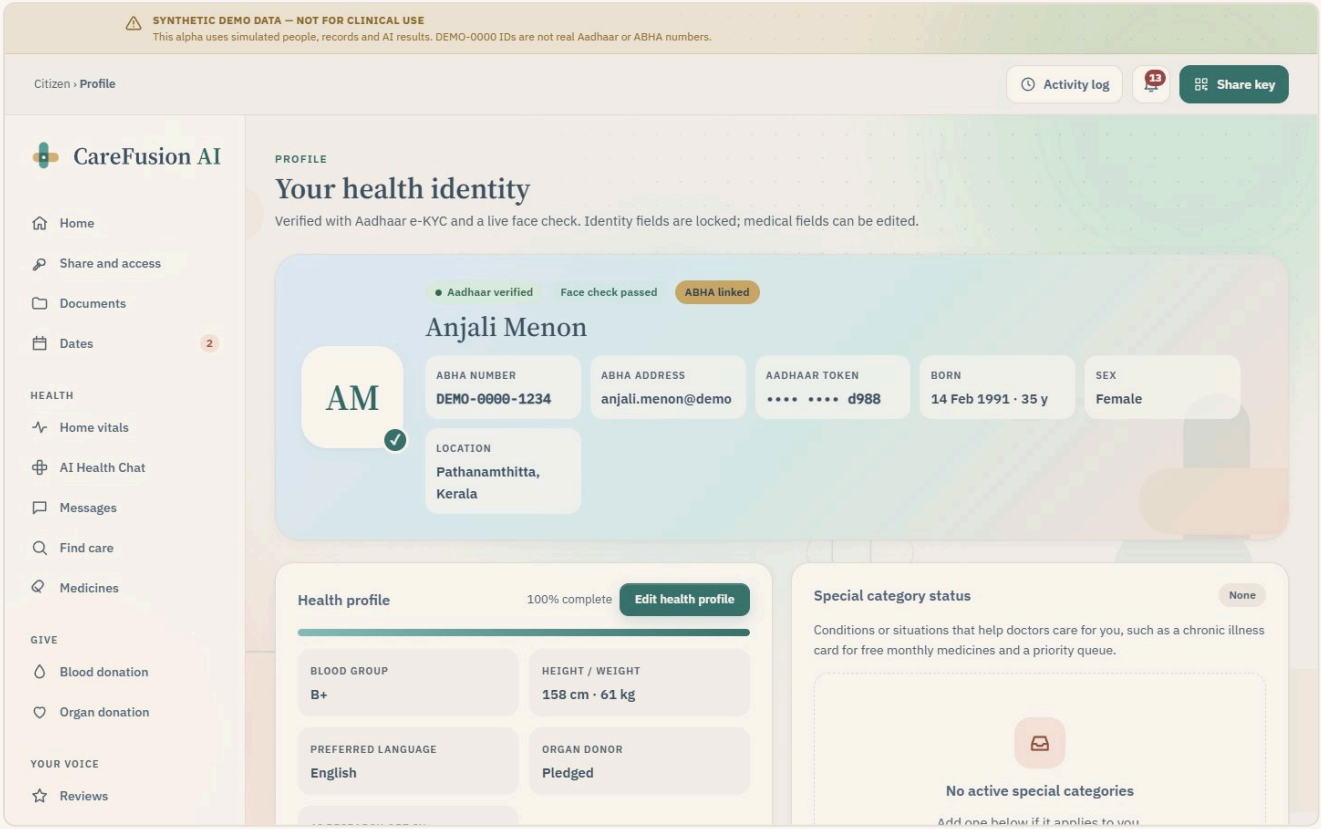

Screenshot of `/citizen/access`

CIT-3

Keep my profile, conditions and emergency card up to date

As a citizen, **I want** to review my identity details, blood group, conditions and emergency contacts **so that** a doctor in an emergency sees the right facts.

- Identity fields that came from verification are locked. Blood group, language and AI preference are editable.
- Special categories such as a diabetes card can be added or ended, and are reviewed by the district office.
- Emergency contacts and the emergency card are shown as a doctor would see them.

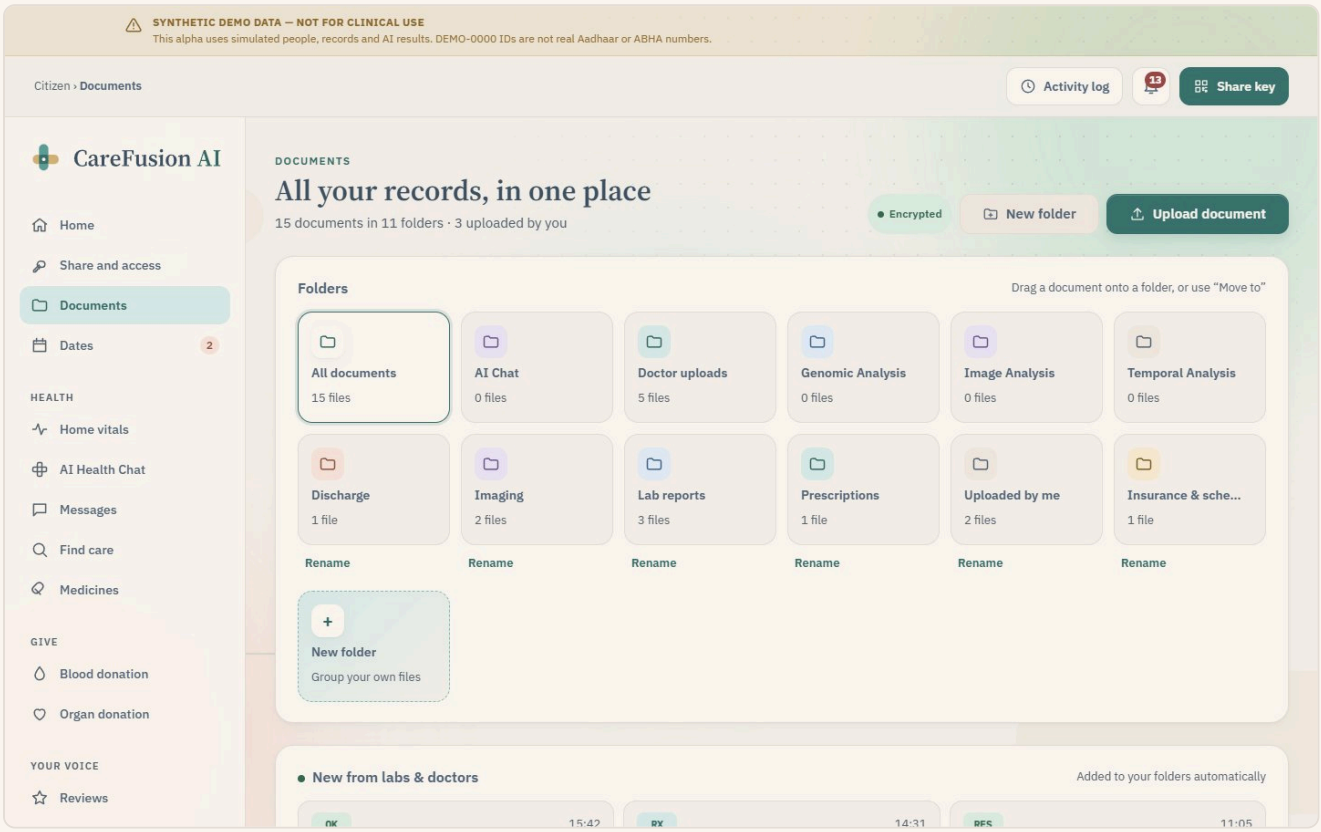

Screenshot of `/citizen/profile`

CIT-4

Keep all my reports in one place

As a citizen, **I want** folders for lab reports, imaging, prescriptions and my own uploads **so that** I never lose a report and can show it when needed.

- System folders are created automatically. I can add my own.
- Upload a PDF, photo or scan. Each file gets a SHA-256 hash, and documents are never edited or deleted.
- Download through a short-lived link, and move a document between folders.
- Reviewed AI summaries appear next to a document only after a doctor has reviewed them.

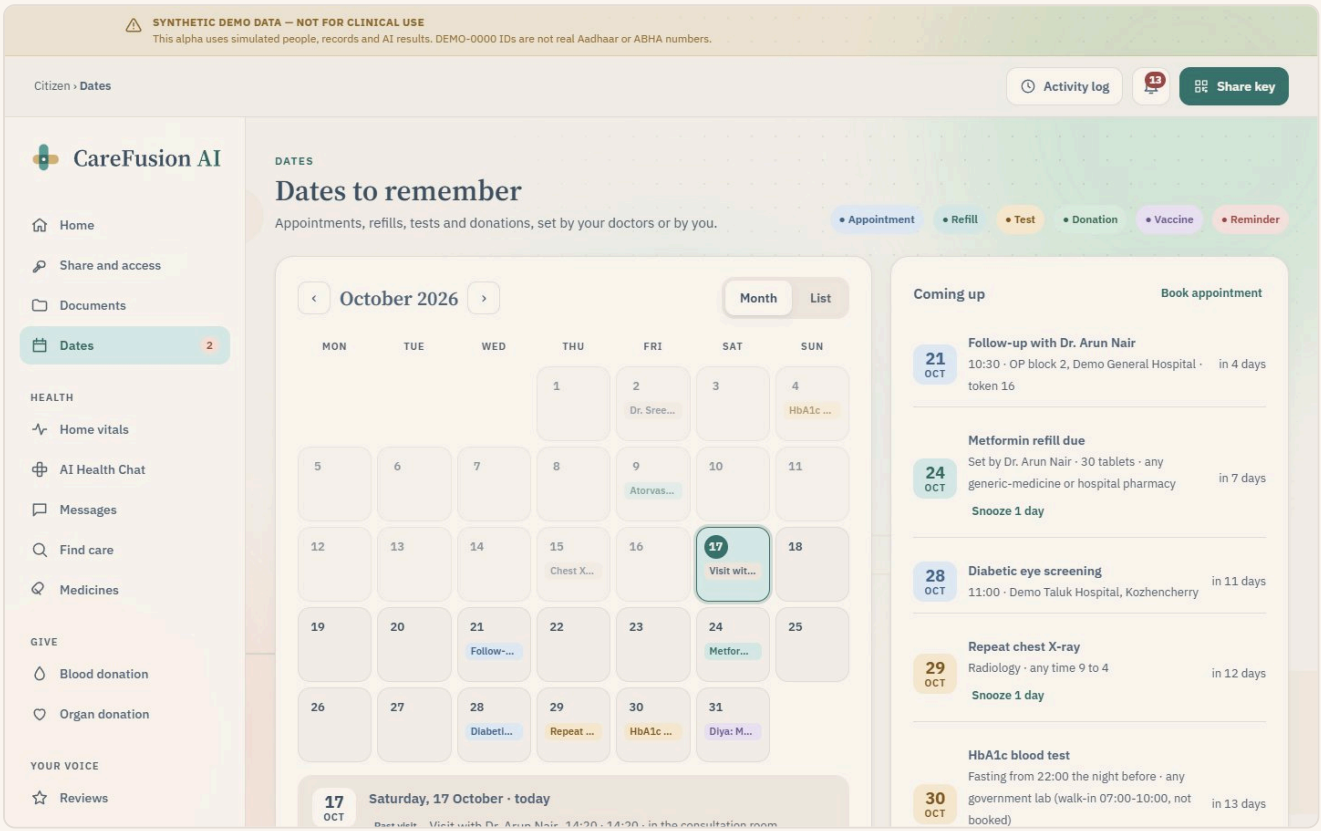

Screenshot of `/citizen/documents`

CIT-5

Never miss an appointment or a test

As a citizen, **I want** a calendar of appointments, tests and refills with reminders **so that** I show up on time and prepared.

- Month calendar with colour-coded events and an upcoming list.
- Add a personal reminder with a repeat rule and a lead time, snooze it or mark it done.
- A phone-calendar link keeps the same dates in my own calendar app.

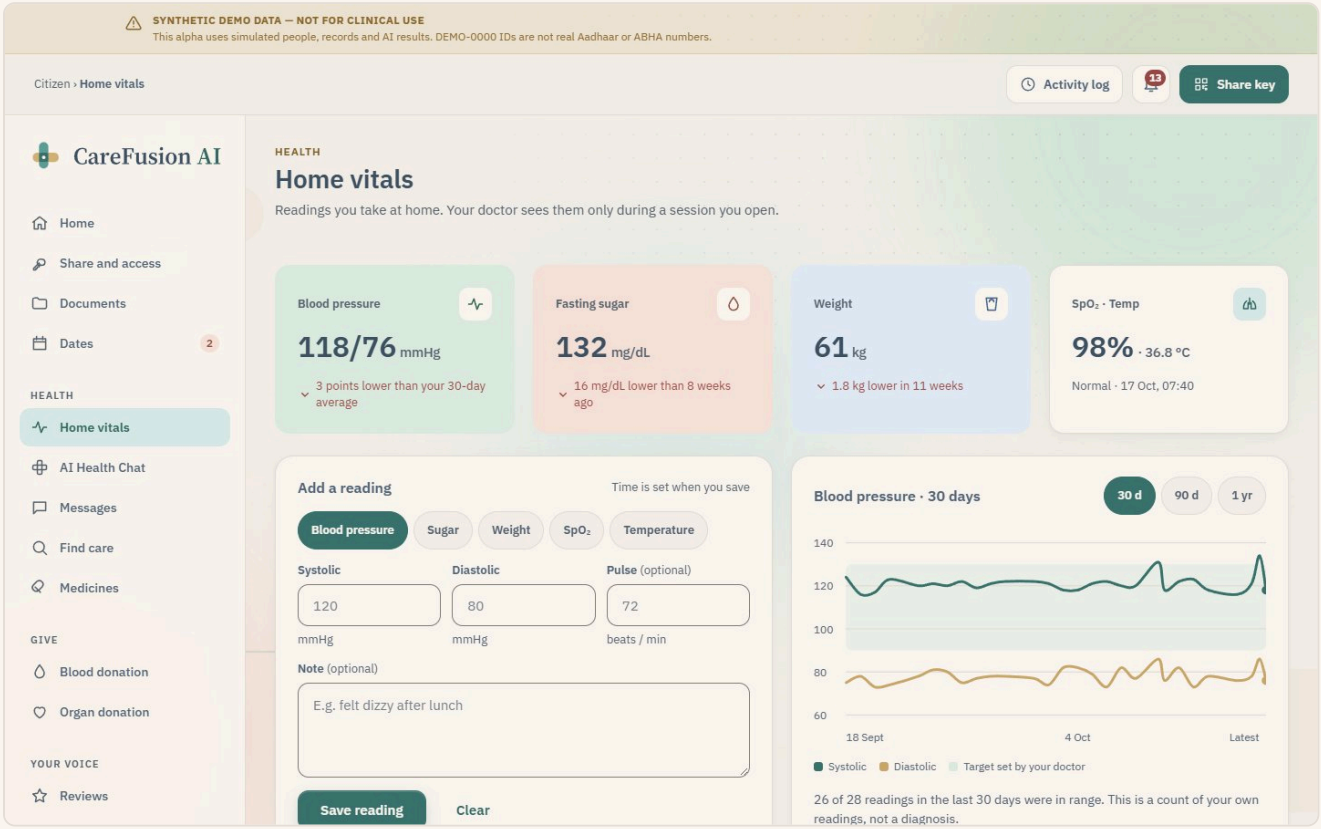

Screenshot of `/citizen/dates`

CIT-6

Track my readings at home

As a citizen with diabetes and blood pressure, **I want** to record my blood pressure, sugar and weight and see trends against my targets **so that** I can tell whether I am on track.

- Latest readings, 30-day average and in-range count (26 of 28).
- Charts for blood pressure, fasting sugar and weight with target bands.
- A reading outside safe limits alerts the last treating doctor and records a clinical alert.

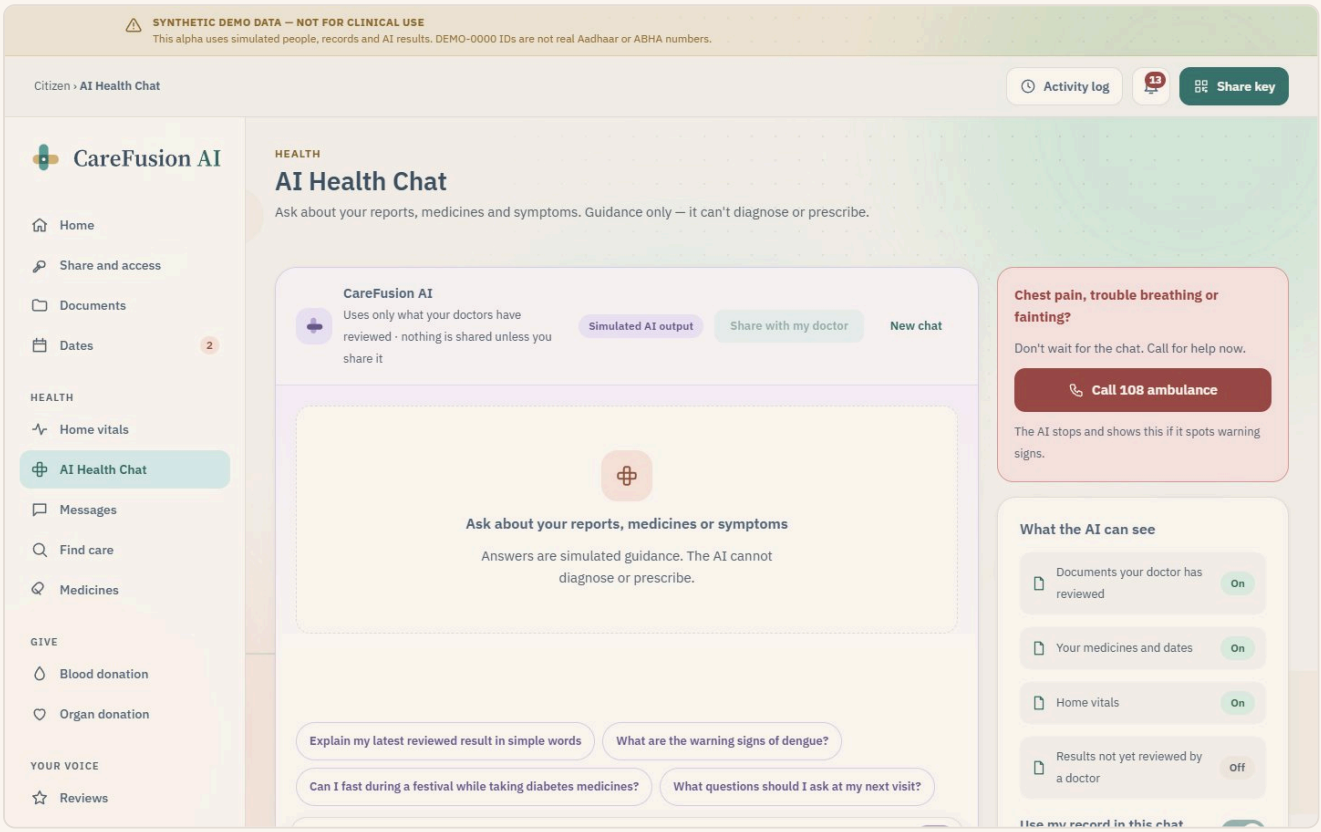

Screenshot of `/citizen/vitals`

CIT-7

Ask a health question and get safe guidance

As a citizen, **I want** a chat that explains my results in plain words **so that** I understand them, without being told to change my own treatment.

- Simulated AI. Every reply is labelled "simulated AI output, not a diagnosis".
- It explains only results a doctor has already reviewed. Anything else says it is waiting for doctor review.
- It stops on red flags such as chest pain and points to 108. It never changes doses.
- A chat can be shared with my doctor.

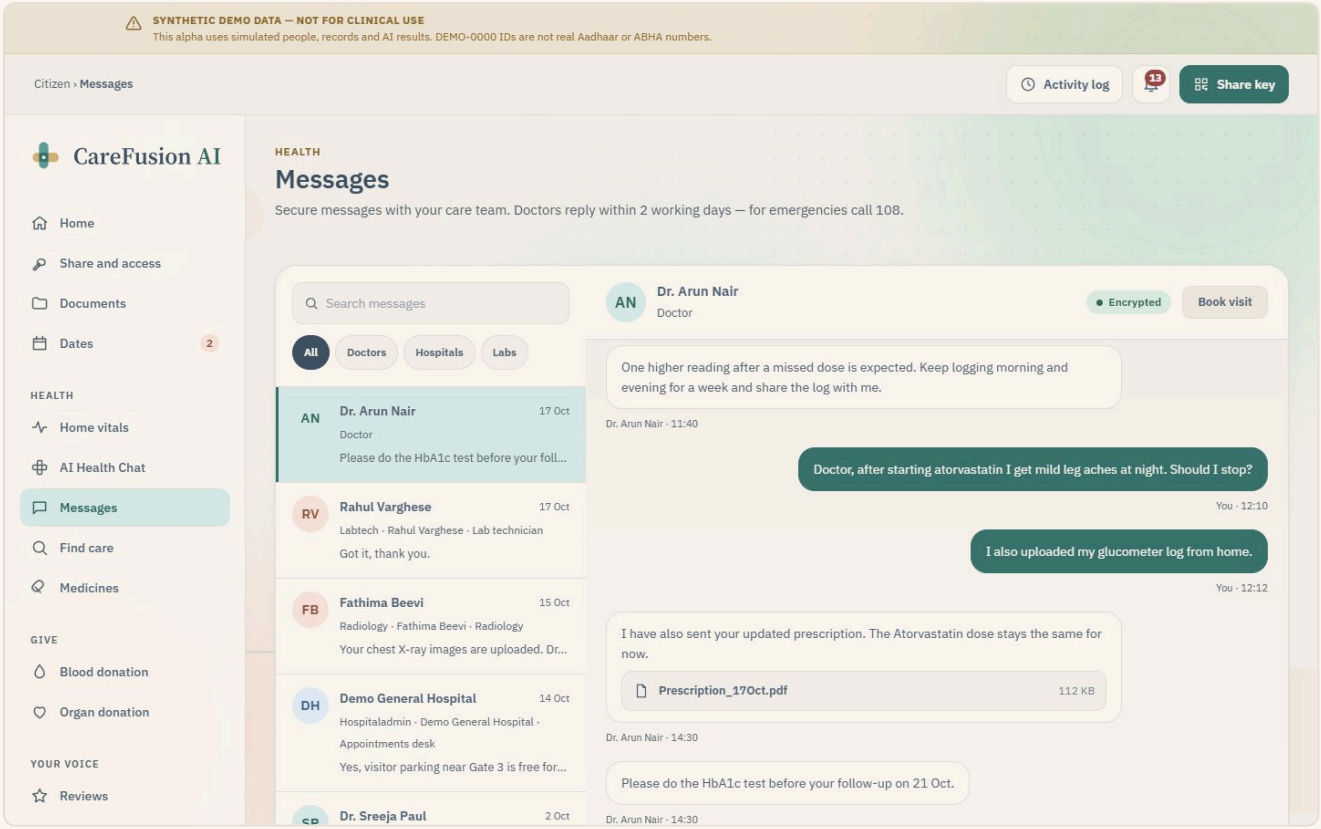

Screenshot of `/citizen/ai-chat`

CIT-8

Message my doctor or the hospital desk

As a citizen, **I want** to send a message and see replies in one thread **so that** I do not have to phone or travel for small questions.

- Threads with doctors, the appointments desk, the lab and radiology.
- Unread counts and read receipts. New messages notify the other side within seconds.
- Attachments are listed in the thread.

Screenshot of `/citizen/messages`

Citizen app: care, medicines, giving and feedback

These eight screens help the citizen find and book care, follow a prescription from signature to collection, donate blood or pledge organs, stay informed, manage their account and give feedback.

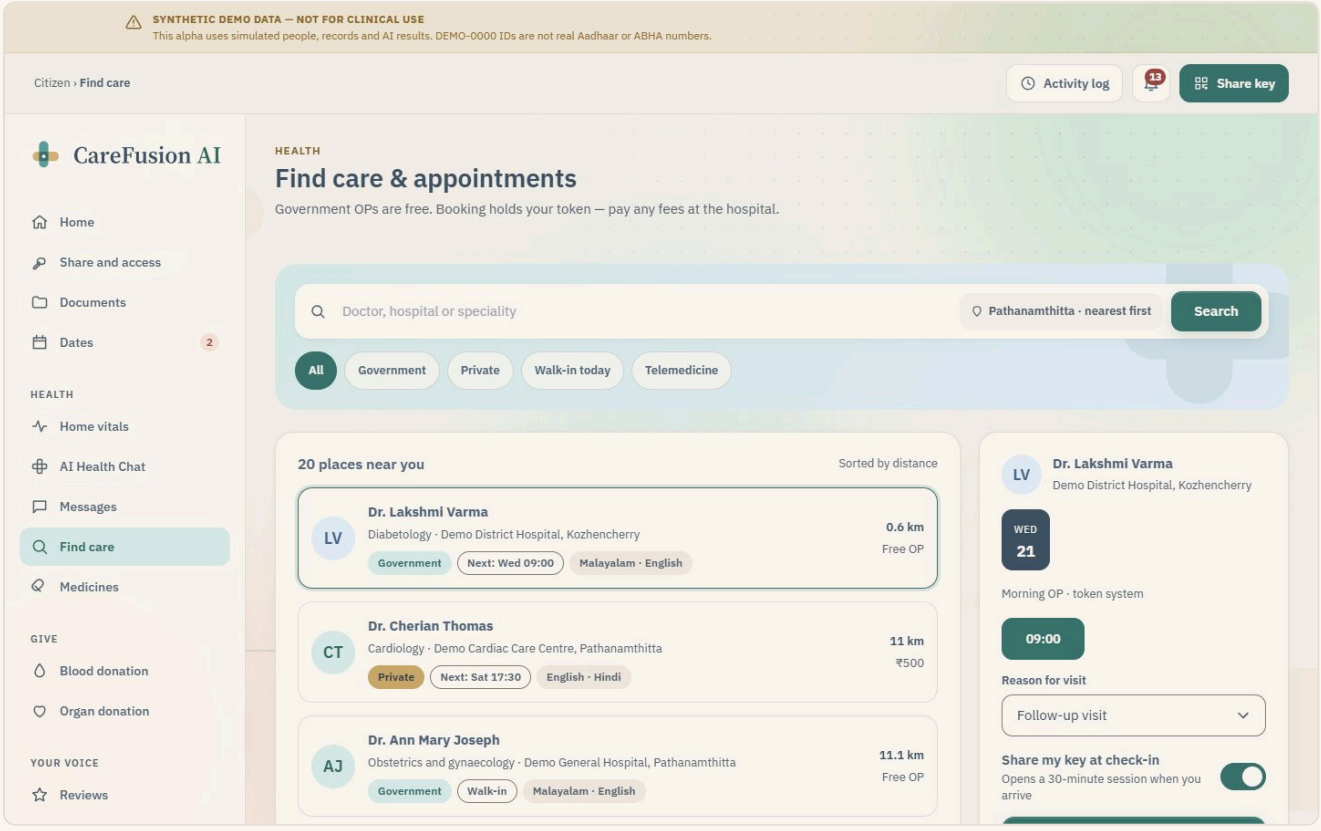

Try it: stay signed in as Anjali Menon and open each item in the left menu.

CIT-9

Find a doctor and book a free appointment

As a citizen, **I want** to search providers, see free slots and book one **so that** I get an appointment without queueing.

- Providers with department, languages, years of experience and a fee shown clearly. "Booking is free. Any fee is paid at the hospital."
- A day strip and slot grid, with full slots greyed out.
- A booking gets a reference (for example DEMO-APT-58213) and a token number, and appears in the doctor's schedule.
- Past visits are listed, and cancelling is one tap.

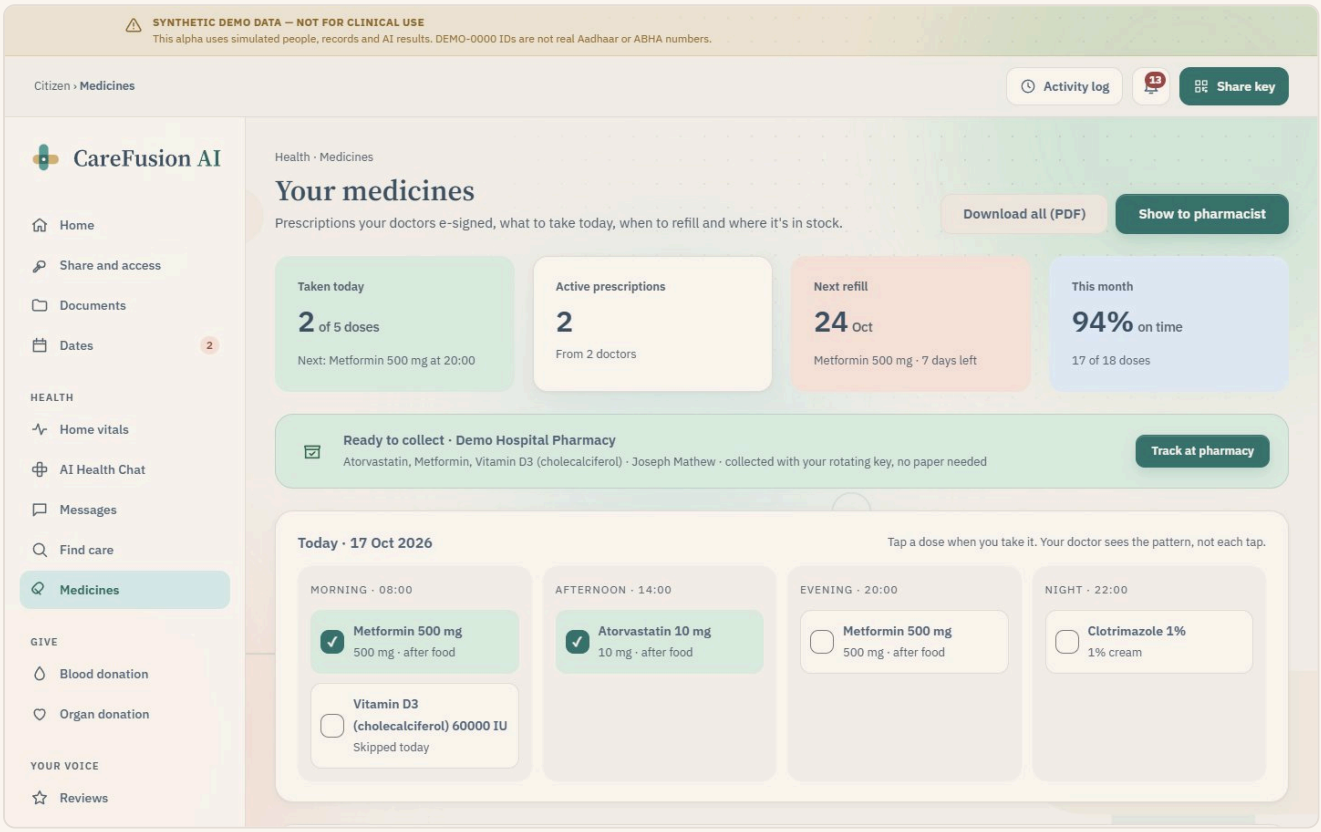

Screenshot of `/citizen/care`

CIT-10

Follow a prescription to the pharmacy counter

As a citizen on long-term medicines, **I want** to see today’s doses, my prescriptions and whether they are ready to collect **so that** I take my medicines on time and do not queue blindly.

- A dose schedule for today with taken or missed (2 of 5 taken).
- A tracker for each prescription: signed, verified, ready, collected, with a queue token.
- A medicine finder shows nearby pharmacies that have stock. Only stock the pharmacy has chosen to publish is shown.
- Refill reminders and past prescriptions.

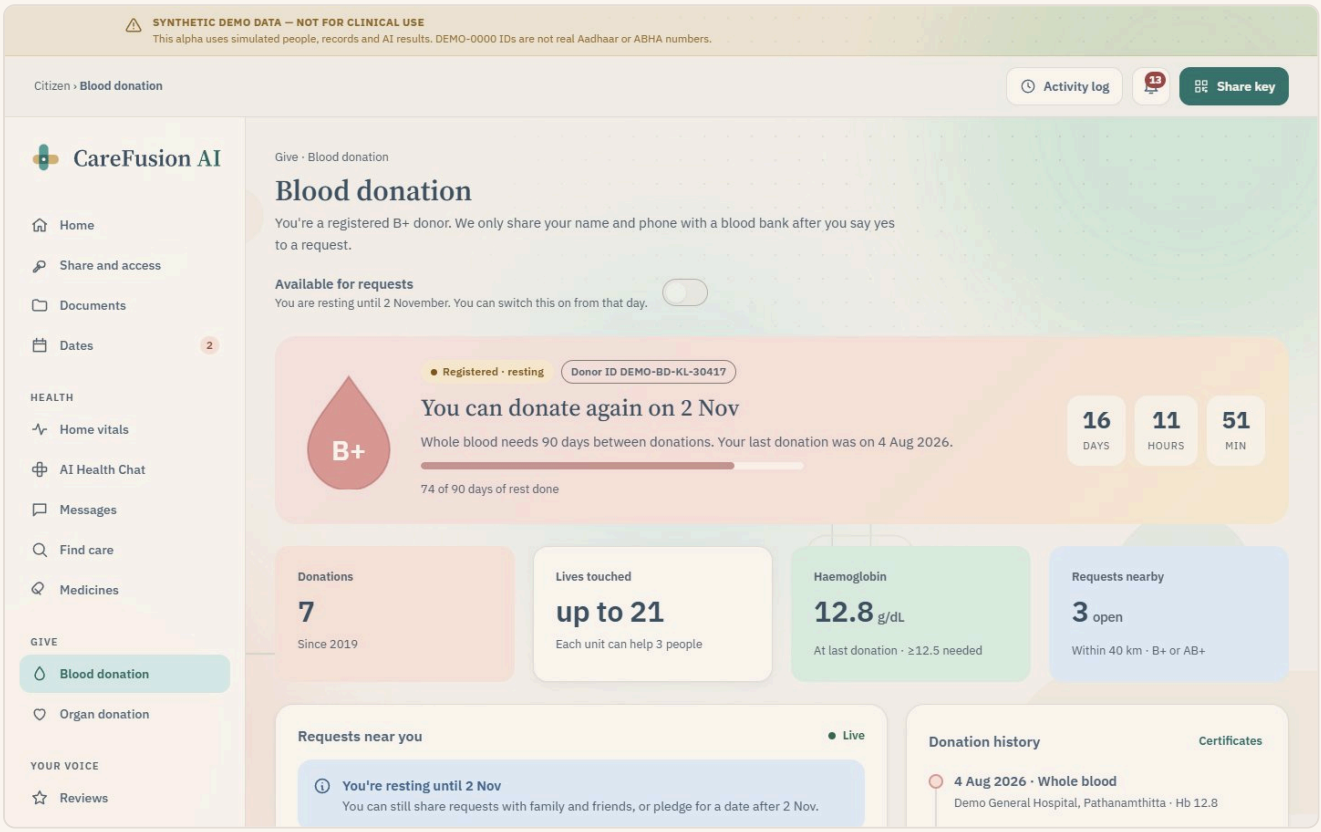

Screenshot of `/citizen/medicines`

CIT-11

Give blood when it is needed nearby

As a blood donor, **I want** to see my eligibility and respond to nearby requests **so that** my donation reaches the patient who needs it.

- Donor status with the rest period counted down. Anjali last donated on 4 August and is eligible again from 2 November.
- Open requests from hospitals within range, with "I can donate" or "I can’t, notify my circle".
- Blood-bank stock by group, donation history and upcoming camps to pledge for.
- Only after I say yes is my name shared with a blood bank.

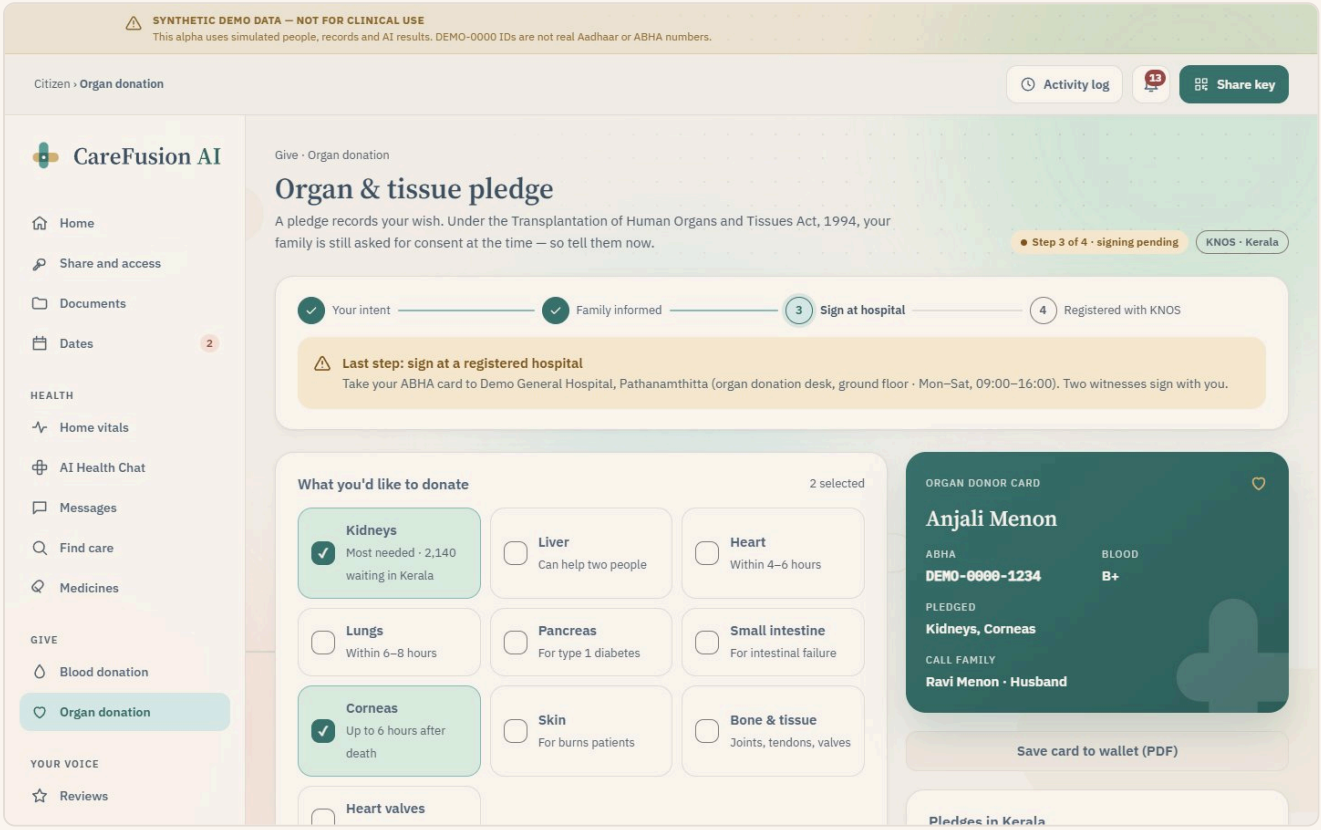

Screenshot of `/citizen/blood`

CIT-12

Pledge my organs, with family involved

As a citizen, **I want** a guided pledge with witnesses and a next-of-kin notice **so that** my wishes are clear and my family is not surprised.

- Four steps: choose organs, tell family, two witnesses (one a relative), register.
- Witness links expire. Reminders can be sent. Withdrawing the pledge is one tap.
- In the demo Anjali is at step 3 of 4 for kidneys and corneas.
- A registered pledge can be looked up only by a designated transplant coordinator, and every lookup is logged.

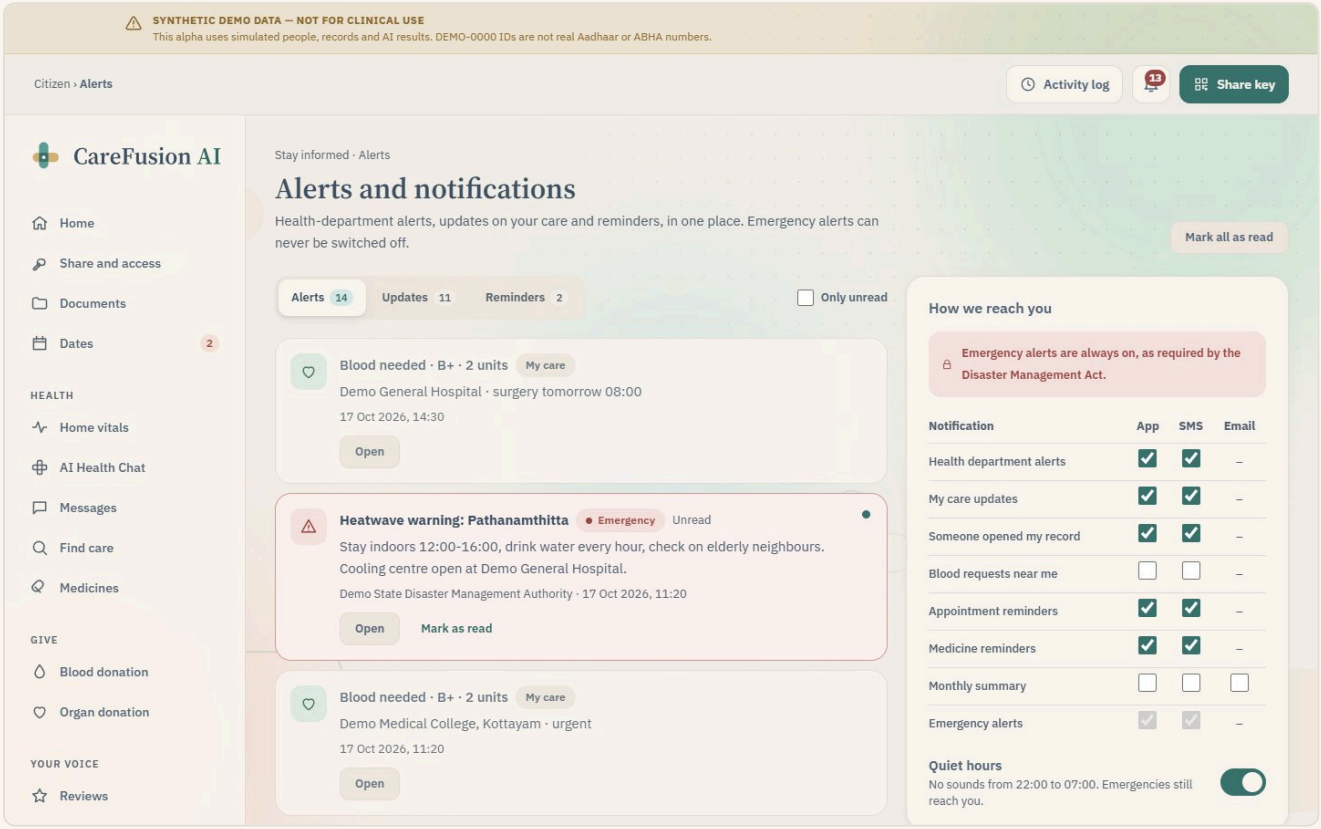

Screenshot of `/citizen/organ`

CIT-13

Hear about health alerts and my own care

As a citizen, **I want** one place for health-department alerts, care updates and reminders **so that** important news reaches me and I control how.

- Tabs for alerts, updates and reminders, with unread markers.
- Emergency alerts (such as the heatwave warning) can never be switched off.
- Choose app, SMS, email or WhatsApp for each kind of notice, and set quiet hours. In the demo, delivery is simulated.

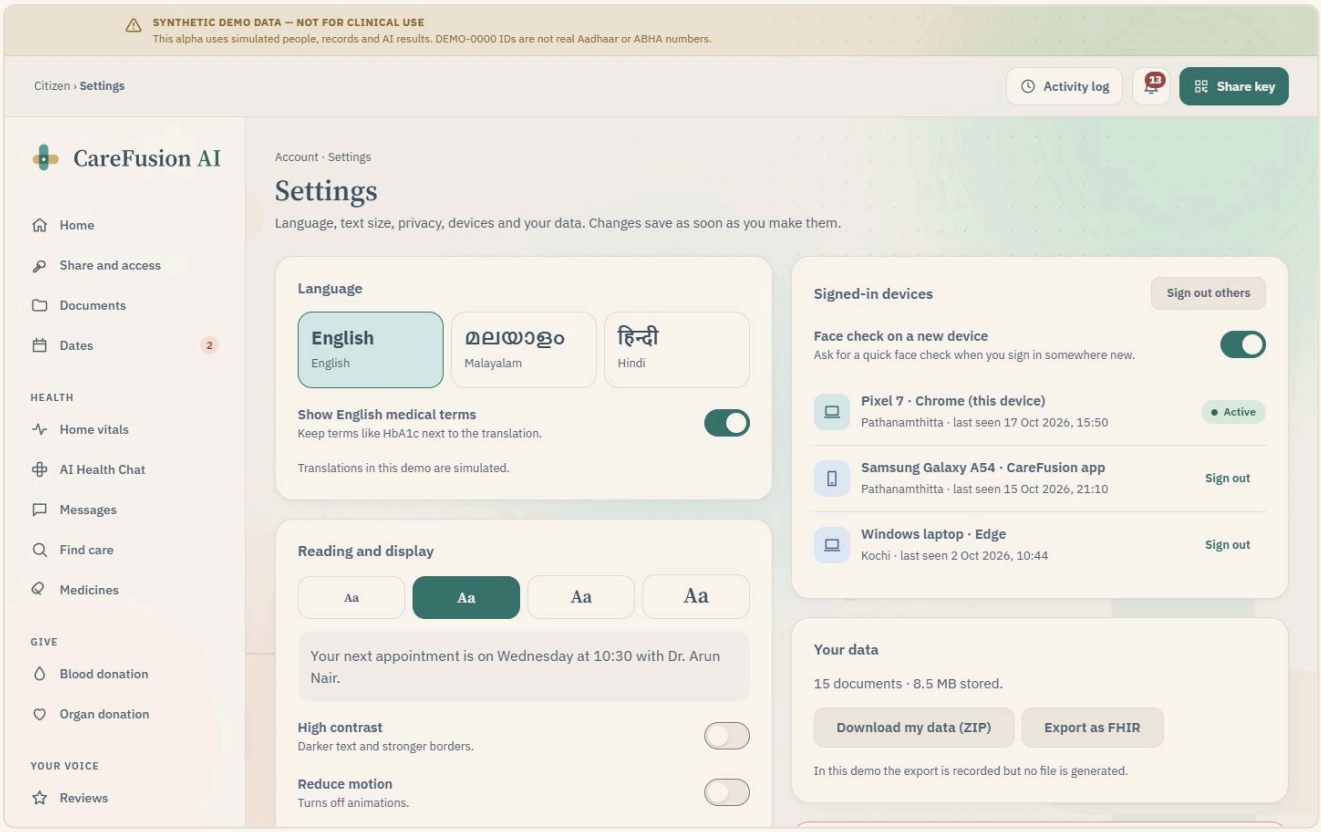

Screenshot of `/citizen/alerts`

CIT-14

Control language, display, devices and my data

As a citizen, **I want** settings for language, text size, privacy, devices and data **so that** the app fits me and my data stays mine.

- English, Malayalam or Hindi (translations are simulated in the demo), text size, high contrast and reduce-motion.
- Privacy switches, including the emergency card without a key.
- See and sign out devices, and ask for a data export.
- Account deletion has a 30-day grace period. Clinical records are never erased.

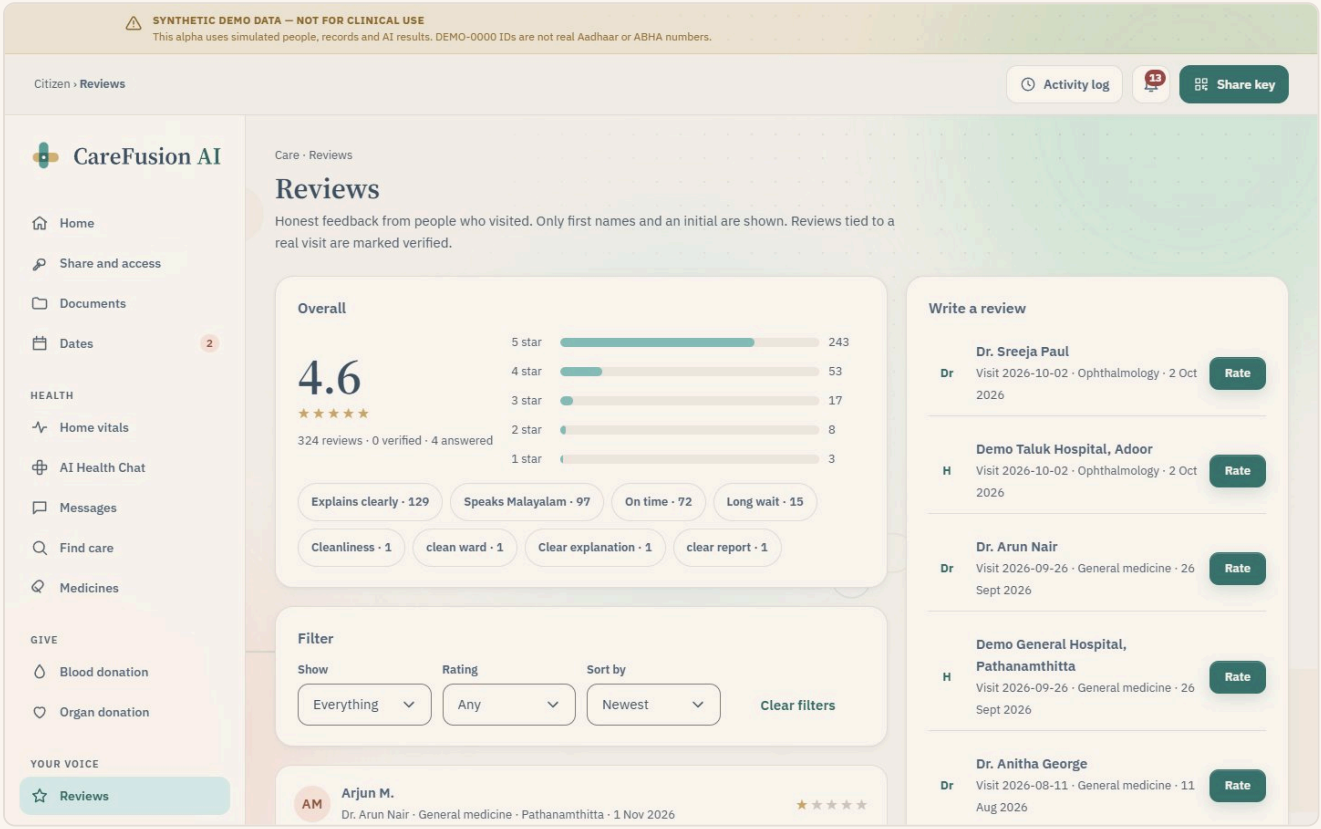

Screenshot of `/citizen/settings`

CIT-15

Review a hospital or doctor I visited

As a citizen, **I want** to rate a visit and read honest reviews **so that** others choose well and services improve.

- Only finished visits can be reviewed, so a review is marked "verified visit".
- Rating summary, distribution, tags and filters by rating and sort order.
- Reviewers show first name and initial only. Hospitals can reply. Any review can be reported.

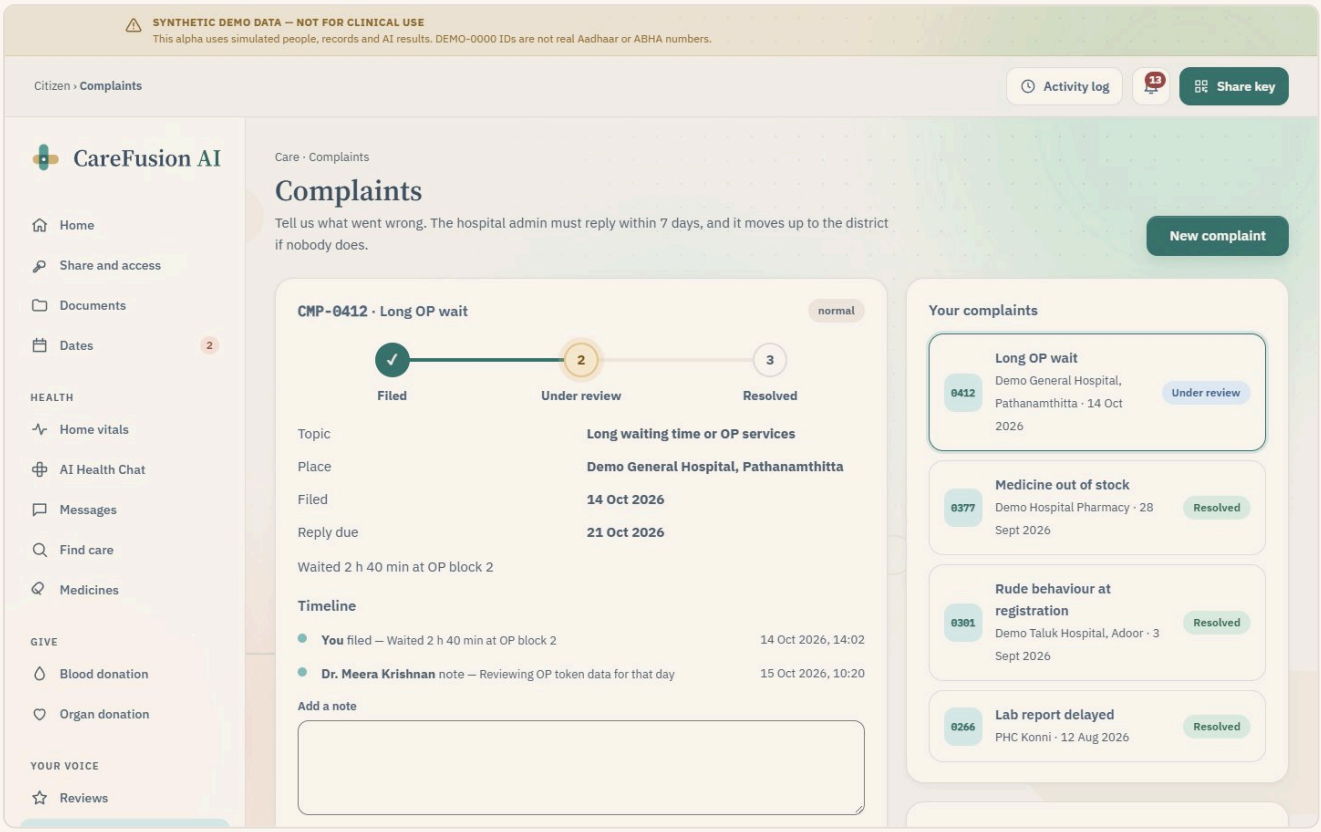

Screenshot of `/citizen/reviews`

CIT-16

File a complaint and watch it move

As a citizen, **I want** to file a complaint and track it to a reply **so that** problems are handled, and escalated if they are ignored.

- A short form: topic, how serious, where it happened.
- A three-step tracker (filed, under review, resolved) and a timeline of every action.
- The hospital admin must reply within 7 days, then it moves up to the district office.
- A resolved complaint can be reopened with a note.

Screenshot of `/citizen/complaints`

Doctor app

A doctor opens a patient only with the patient's key, or through a logged emergency override. Inside a session they get a summary, simulated AI hints that always need their review, prescribing with safety checks, and orders that reach the lab and radiology. The demo doctor is Dr. Arun Nair, General medicine, Demo General Hospital.

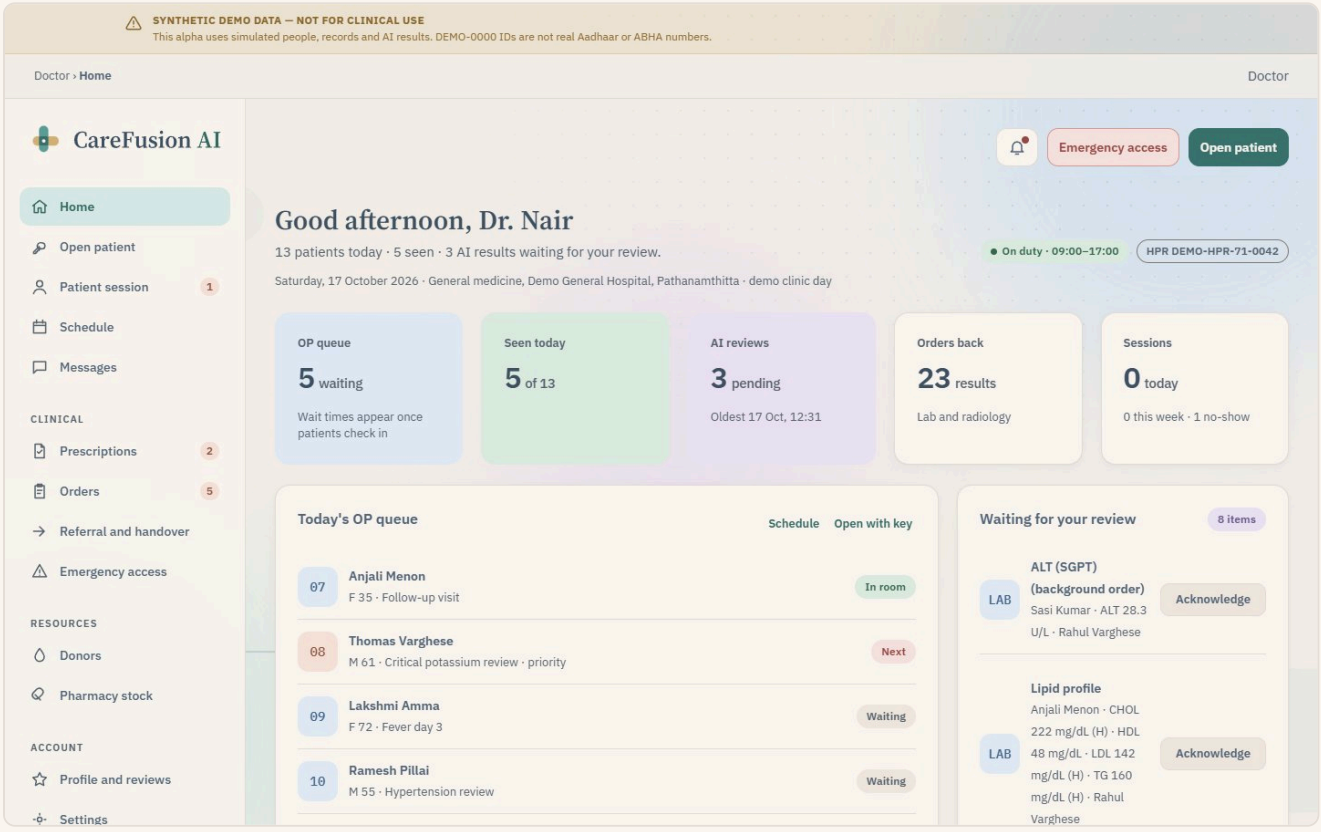

Try it: open /demo-signin and choose Doctor. To open Anjali's record, copy the 6-digit key from her Share and access page.

DOC-1

Start the day with the queue and what needs my review

As a doctor, **I want** a home page with today's patients, results waiting and alerts **so that** I see what to do first.

- Greeting with duty hours and HPR ID, and counts for the OP queue, patients seen, AI reviews pending and orders back.
- Today's queue with tokens: Anjali (in room), Thomas Varghese (next, critical potassium), and more.
- A "Waiting for your review" list of lab and imaging results to acknowledge.
- Shortcuts to Open patient and Emergency access.

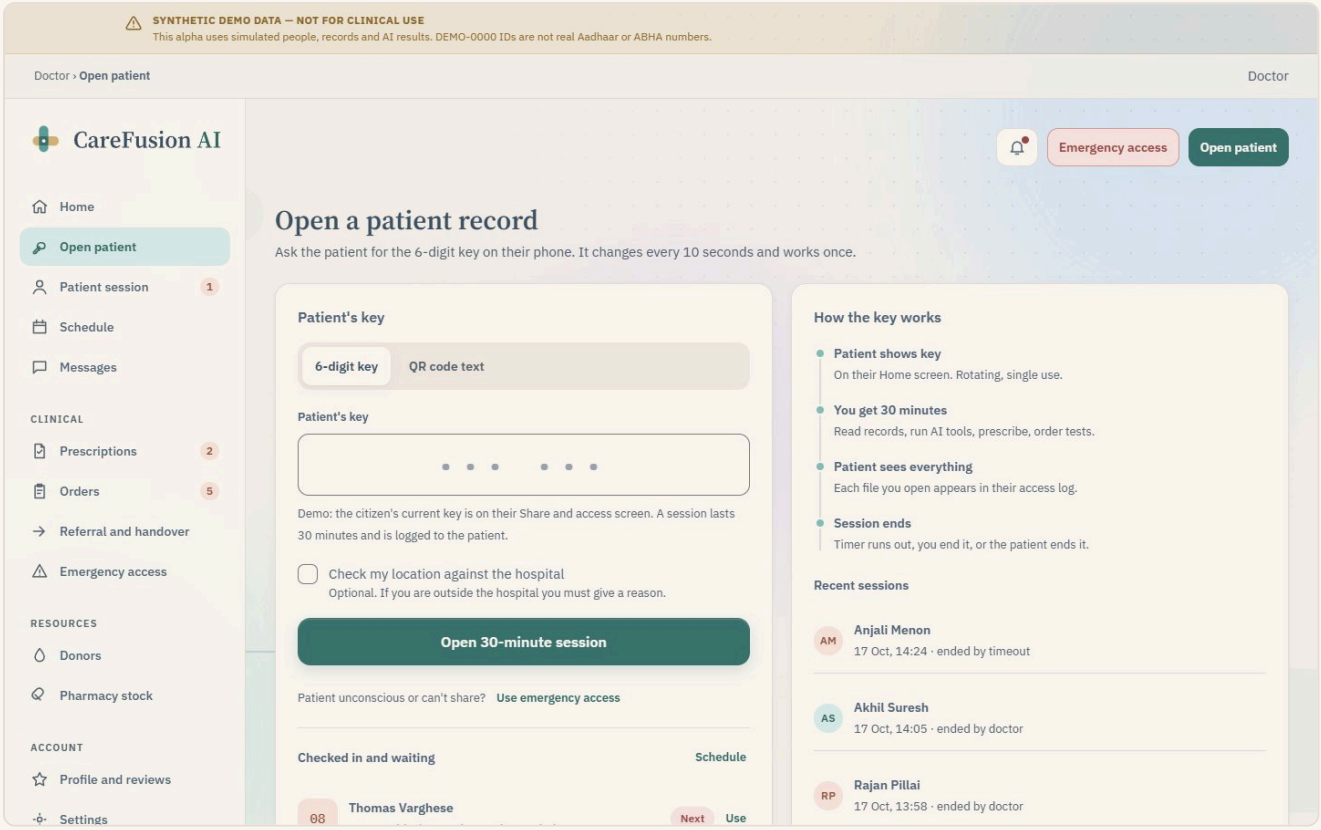

Screenshot of `/doctor`

DOC-2

Open a patient with their key

As a doctor, **I want** to type or scan the patient's rotating key **so that** I get access that the patient has agreed to.

- A key opens a 30-minute session once. Reuse is refused.
- Opening a patient outside a registered hospital area needs a stated reason.
- The patient's hidden categories stay hidden. A countdown shows the time left and the session can be ended at any time.
- Afterwards I see only the patient's name and what I added myself.

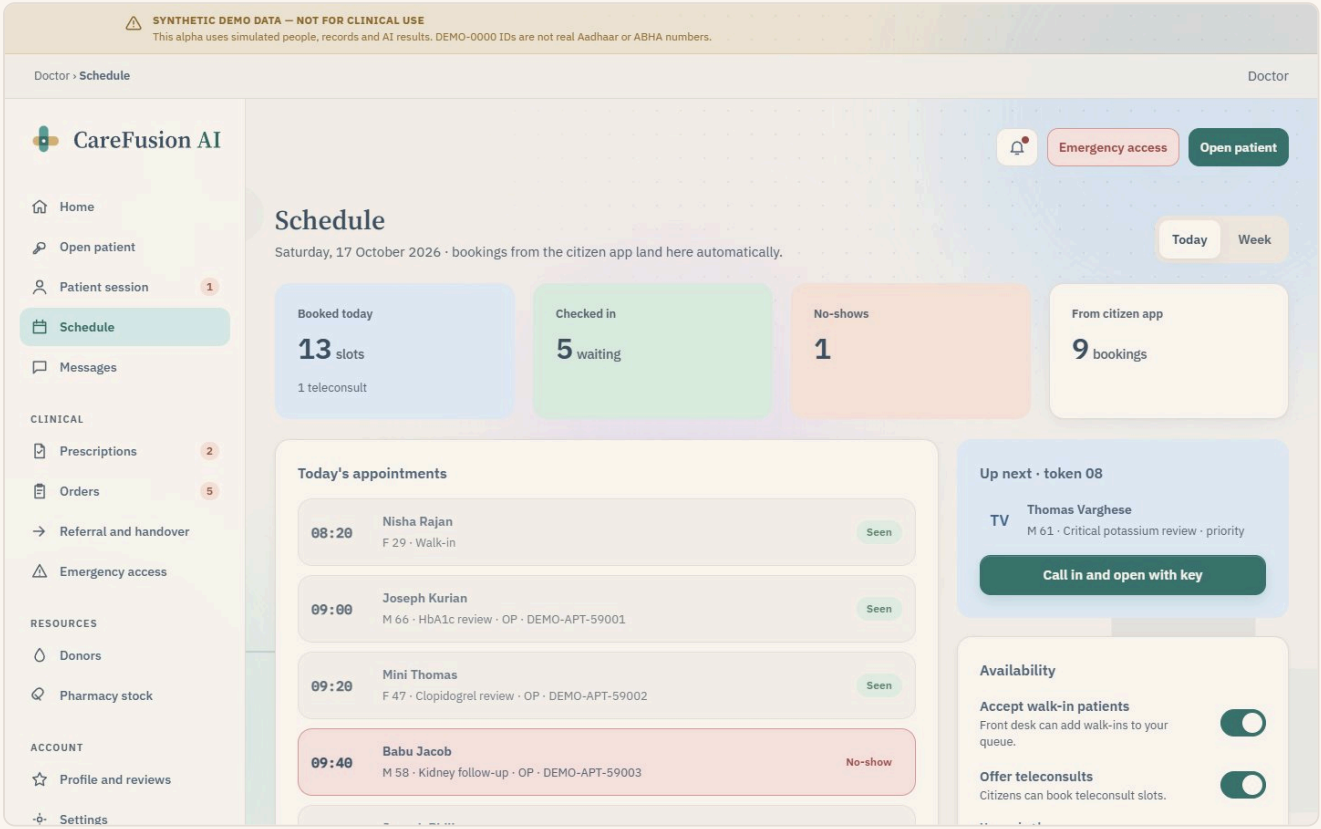

Screenshot of `/doctor?section=open`

DOC-3

Plan my week

As a doctor, **I want** a schedule of booked patients, free slots and blocks **so that** I can see when I am booked and when I am free.

- Day and week view of appointments made from the citizen app, with token numbers.
- Schedule blocks for clinics and teleconsults.
- New bookings show up within seconds.

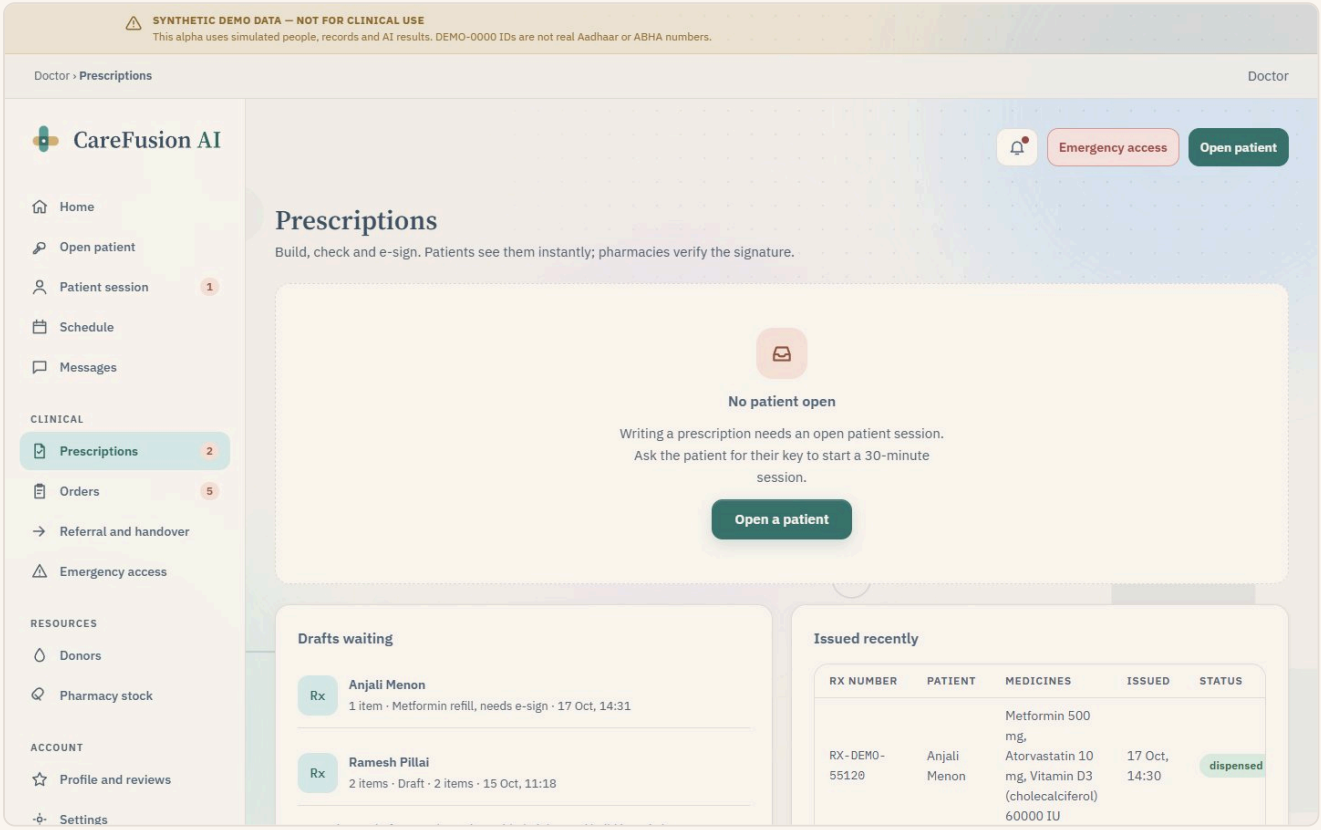

Screenshot of `/doctor?section=schedule`

DOC-4

Prescribe safely and sign electronically

As a doctor, **I want** to build a prescription with allergy and interaction checks **so that** I do not send the patient something harmful.

- Pick medicines and set dose, frequency and duration.
- A penicillin-class allergy or a major interaction blocks signing unless I give an override reason.
- Save a draft, or sign with a mock e-Sign. Signing creates the prescription, a PDF in the patient's documents and a delivery to the hospital pharmacy.
- The pharmacist and the citizen are notified.

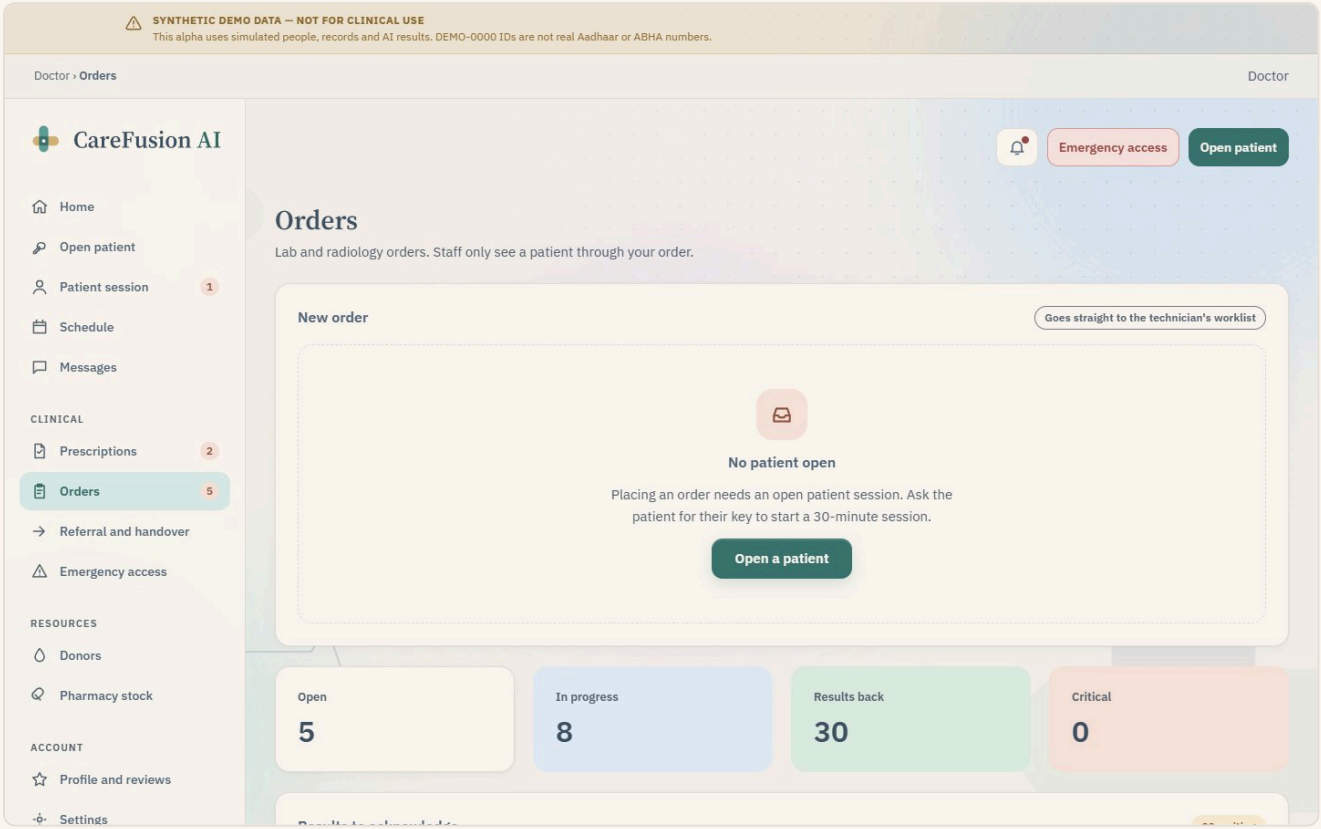

Screenshot of `/doctor?section=rx`

DOC-5

Order tests and read results

As a doctor, **I want** to order lab and imaging tests and acknowledge results **so that** the right team does the work and I see the answer.

- Orders get a reference such as ORD-DEMO-0001, a priority and a note.
- They appear on the lab technician’s or radiologist’s worklist right away.
- Results come back with flags. I acknowledge them, which tells the lab I have seen them.

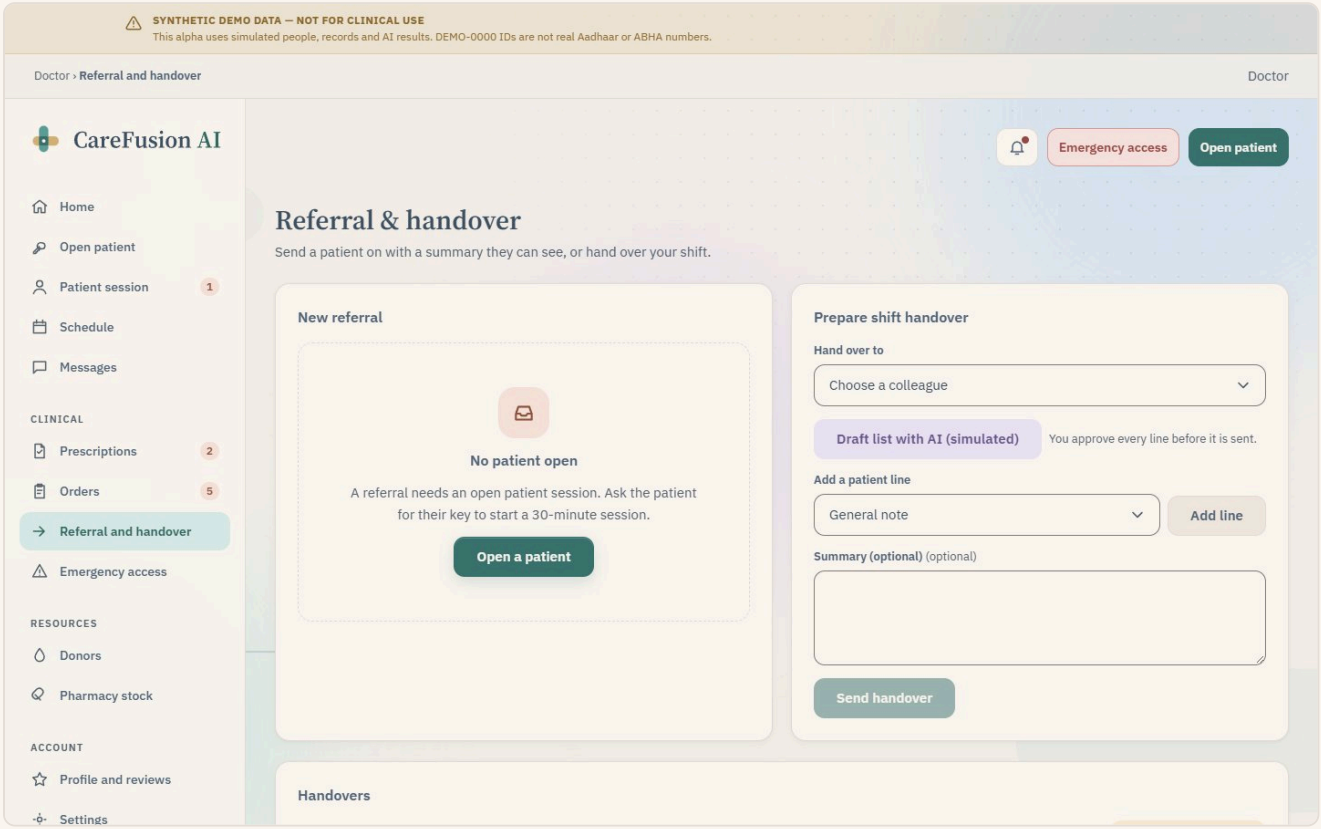

Screenshot of `/doctor?section=orders`

DOC-6

Refer a patient or hand over the shift

As a doctor, **I want** to refer to another doctor and write a handover **so that** care continues without losing context.

- Choose a destination hospital and doctor, add a reason, and track the referral status.
- A simulated AI draft helps write the handover. I always edit and sign it.
- The receiving doctor signs to accept.

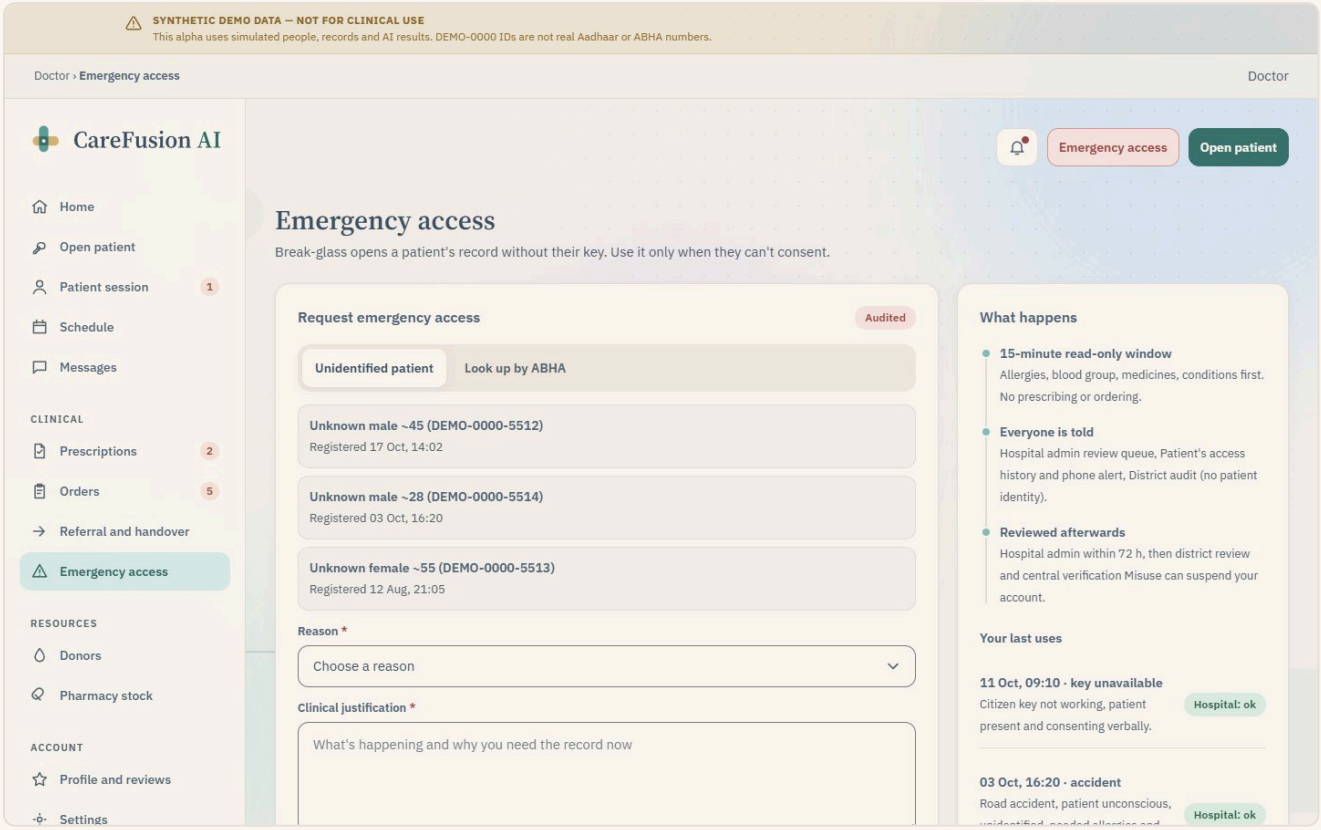

Screenshot of `/doctor?section=referral`

DOC-7

Handle an emergency when the patient cannot give a key

As a doctor in an emergency, **I want** a break-glass override with a reason and a second doctor **so that** I can treat now, and the use is fully accountable.

- Reason of at least 20 characters, a category and a second, different doctor from the same hospital.
- Access is read-only and lasts a short window. A banner shows the time left.
- The hospital admin must review every use. The patient is told, with no other patient's name exposed to anyone else.
- Unknown patients can be handled with a temporary identity.

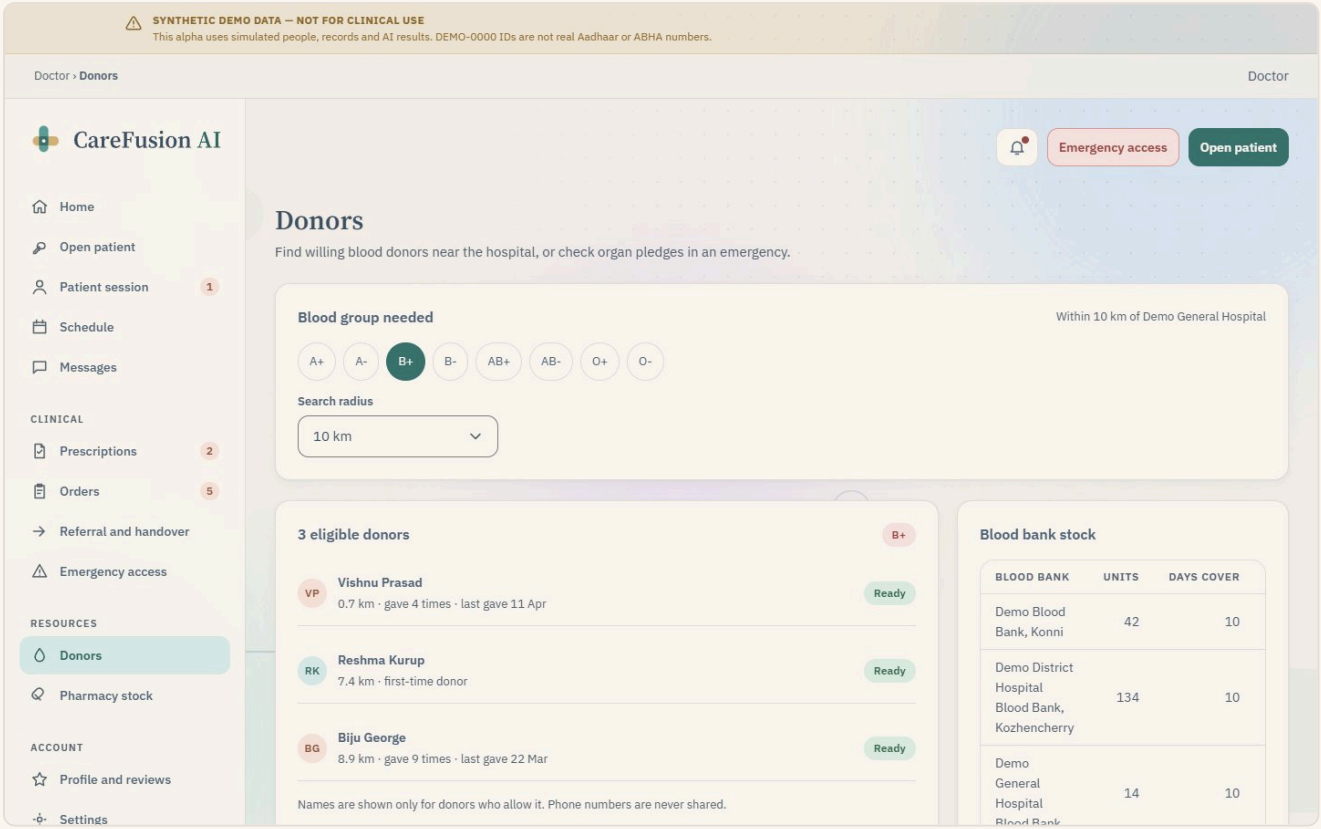

Screenshot of `/doctor?section=emergency`

DOC-8

Find donors and check pharmacy stock

As a doctor, **I want** to find blood donors nearby and see what the pharmacy holds **so that** a surgery or a prescription is not held up.

- Donors filtered by blood group and distance, with blood-bank cover.
- Raise a blood request that nearby donors and the district see.
- A pharmacy stock lookup before prescribing.

Screenshot of `/doctor?section=donors`

Nurse, lab technician and radiology technician

Hospital staff work from orders and a ward, not from a patient's full record. Each role sees only what its job needs. The demo people are Lekha Pillai (Ward 3 nurse), Rahul Varghese (pathology lab) and Fathima Beevi (imaging).

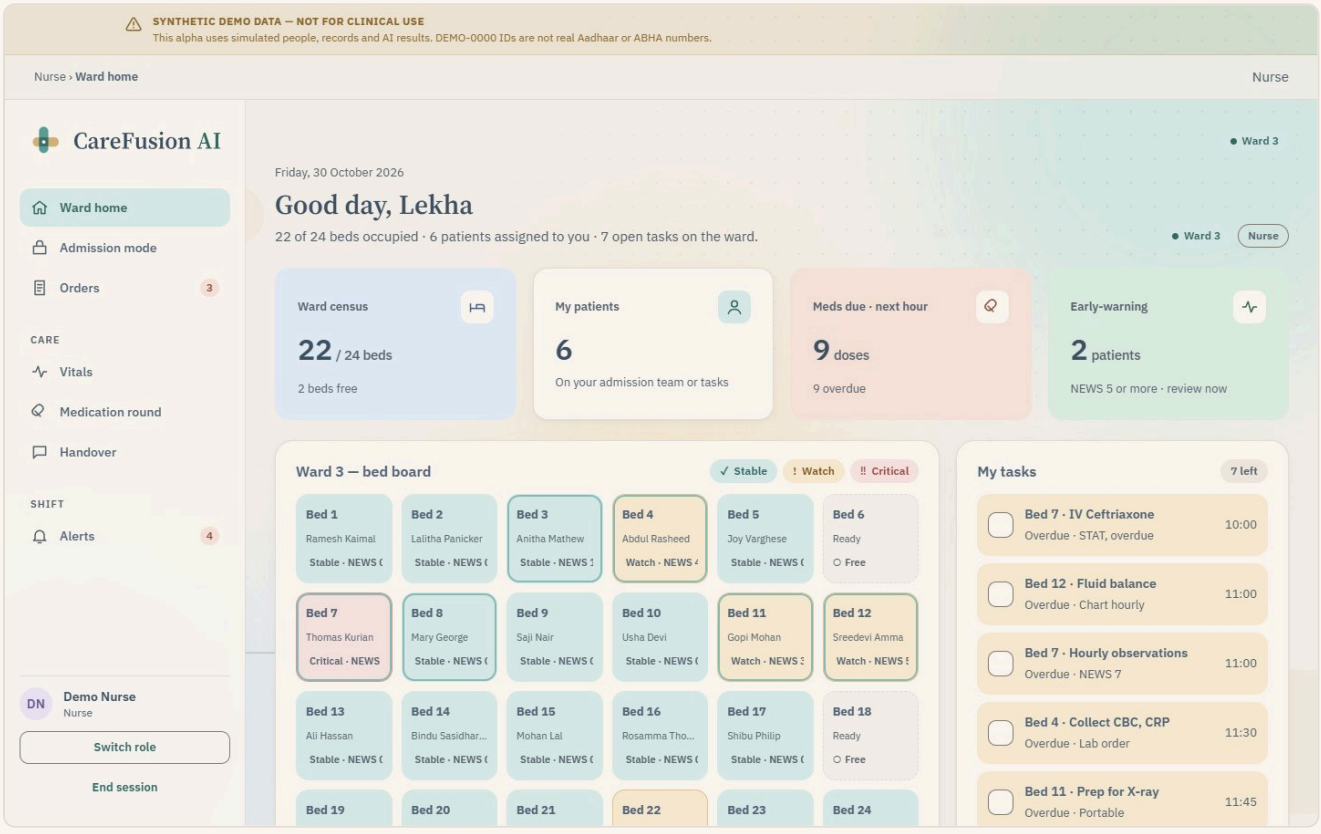

Try it: open /demo-signin and choose Nurse, Lab technician or Radiology technician.

NUR-1

See my whole ward on one board

As a ward nurse, **I want** a bed board with each patient's early-warning level **so that** I know who needs me first.

- 24 beds for Ward 3, 22 occupied, with colour and a word for Stable, Watch or Critical (never colour alone).
- Counts for patients assigned to me, doses due in the next hour and patients with NEWS 5 or more.
- My tasks list with overdue items marked.
- Bed 7 is critical in the demo data.

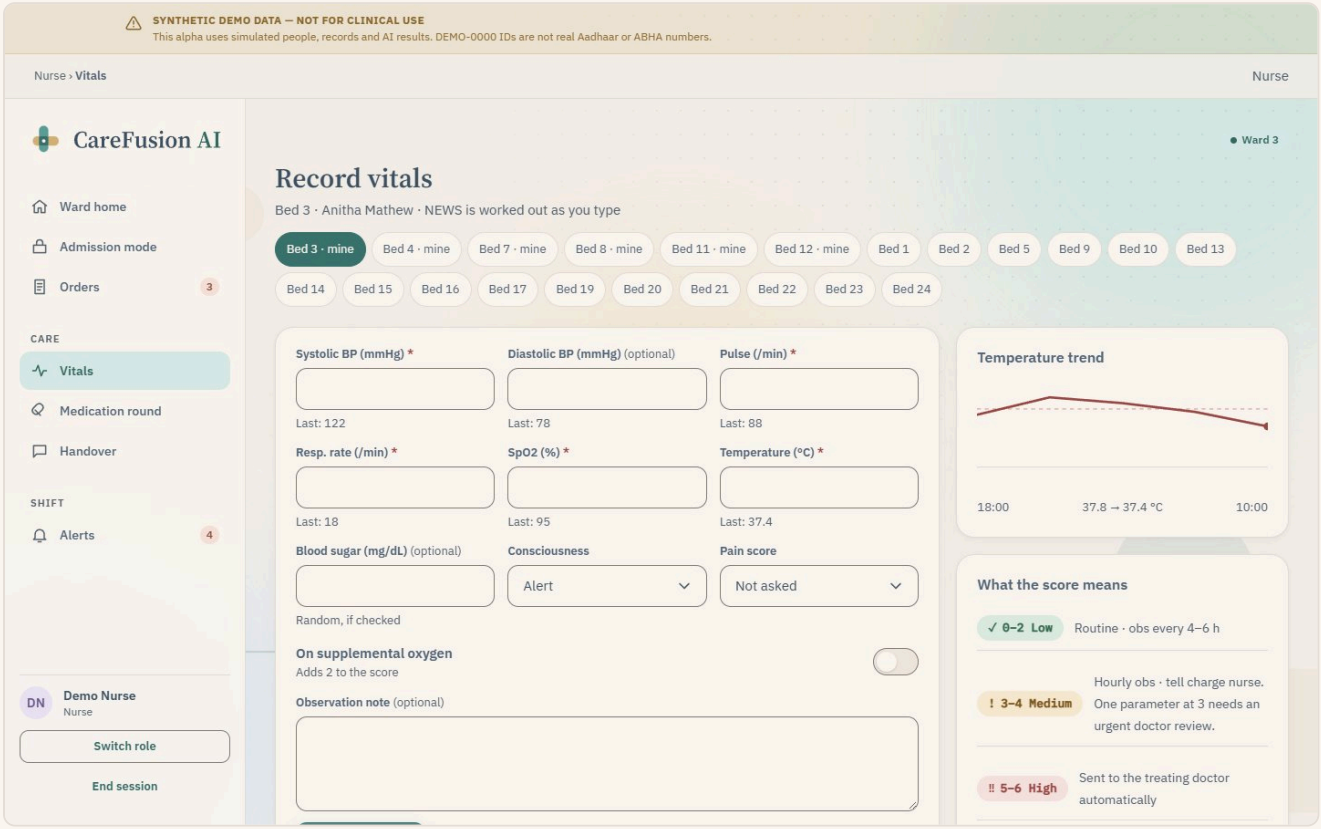

Screenshot of /nurse

NUR-2

Record vitals and get an early-warning score

As a nurse, **I want** to enter a patient's vitals and see a NEWS2 score at once **so that** a deteriorating patient is escalated quickly.

- Enter pulse, blood pressure, temperature, SpO2, respiration and consciousness.
- The score and band are calculated from the entries. A medium or high band escalates along the ward's chain and notifies the doctor.
- The trend for the patient is shown beside the entry.

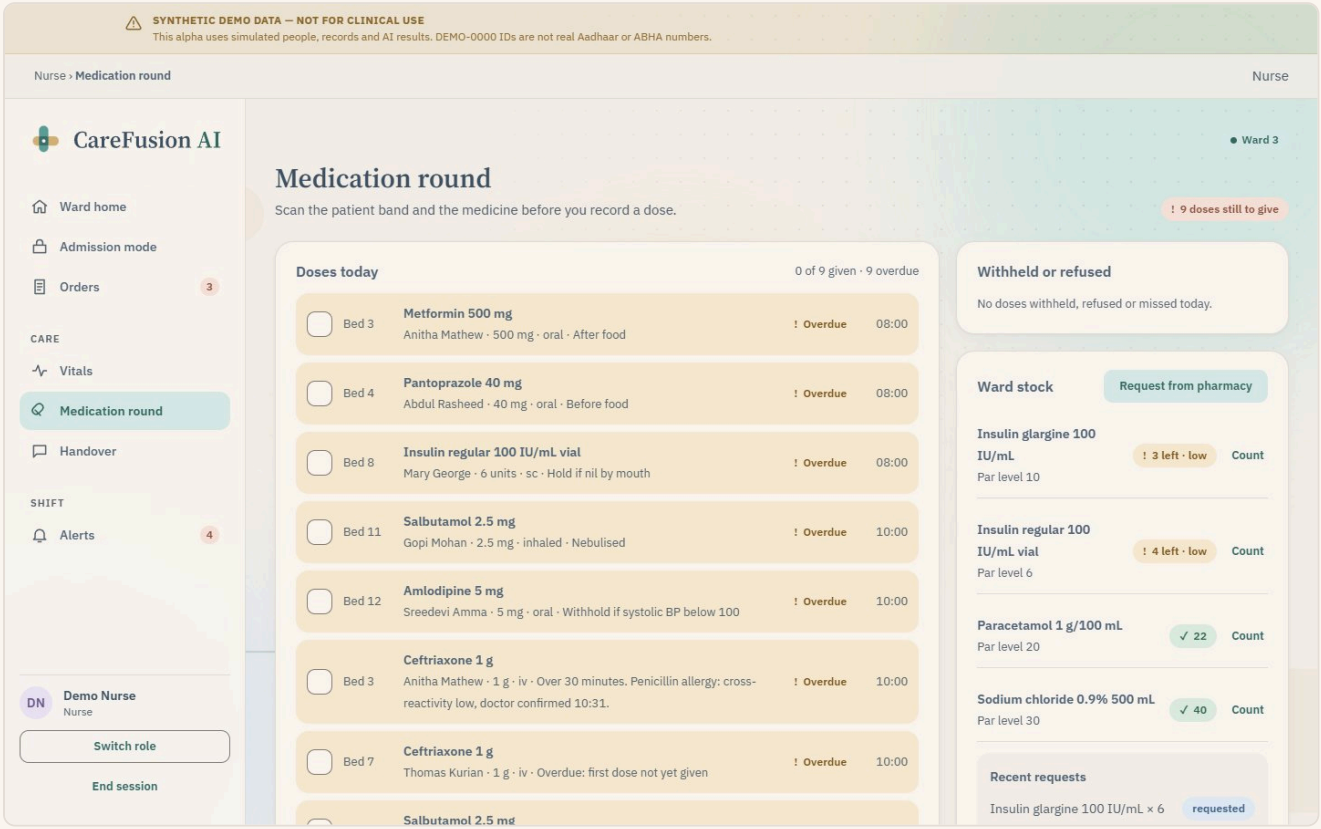

Screenshot of `/nurse?section=vitals`

NUR-3

Run the medication round

As a nurse, **I want** a list of doses due and a way to record given, withheld or refused **so that** every dose is documented and nothing is double-given.

- Doses by time with status due, overdue, given, withheld or refused.
- A duplicate dose or an impossible time is refused.
- Each action is stamped with my name and time.

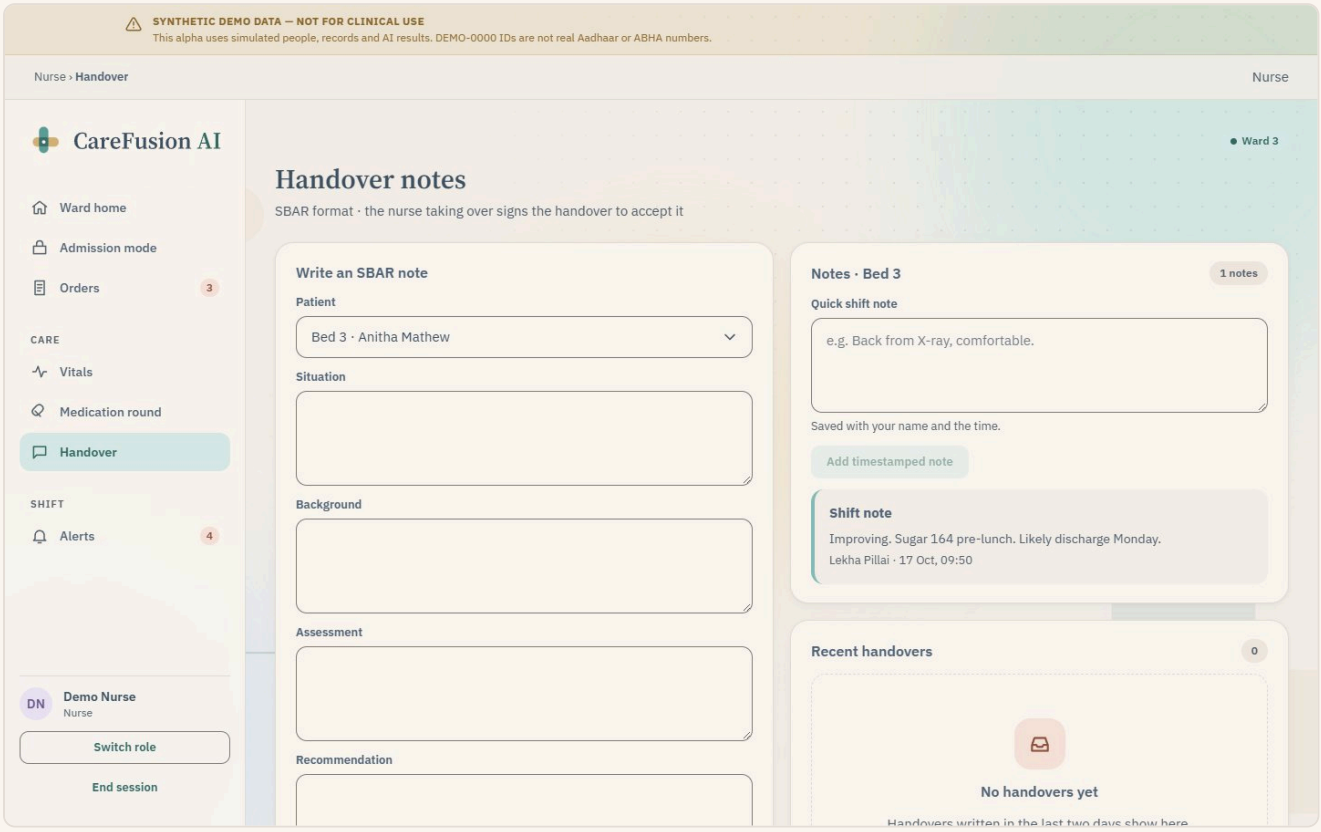

Screenshot of `/nurse?section=mar`

NUR-4

Hand the ward over at shift change

As a nurse, **I want** a structured handover for the next nurse **so that** nothing important is lost.

- Items per patient with flags, and a simulated AI draft I can edit.
- The incoming nurse signs to accept. Open items can be ticked off.
- The same handover pattern is used by lab and radiology.

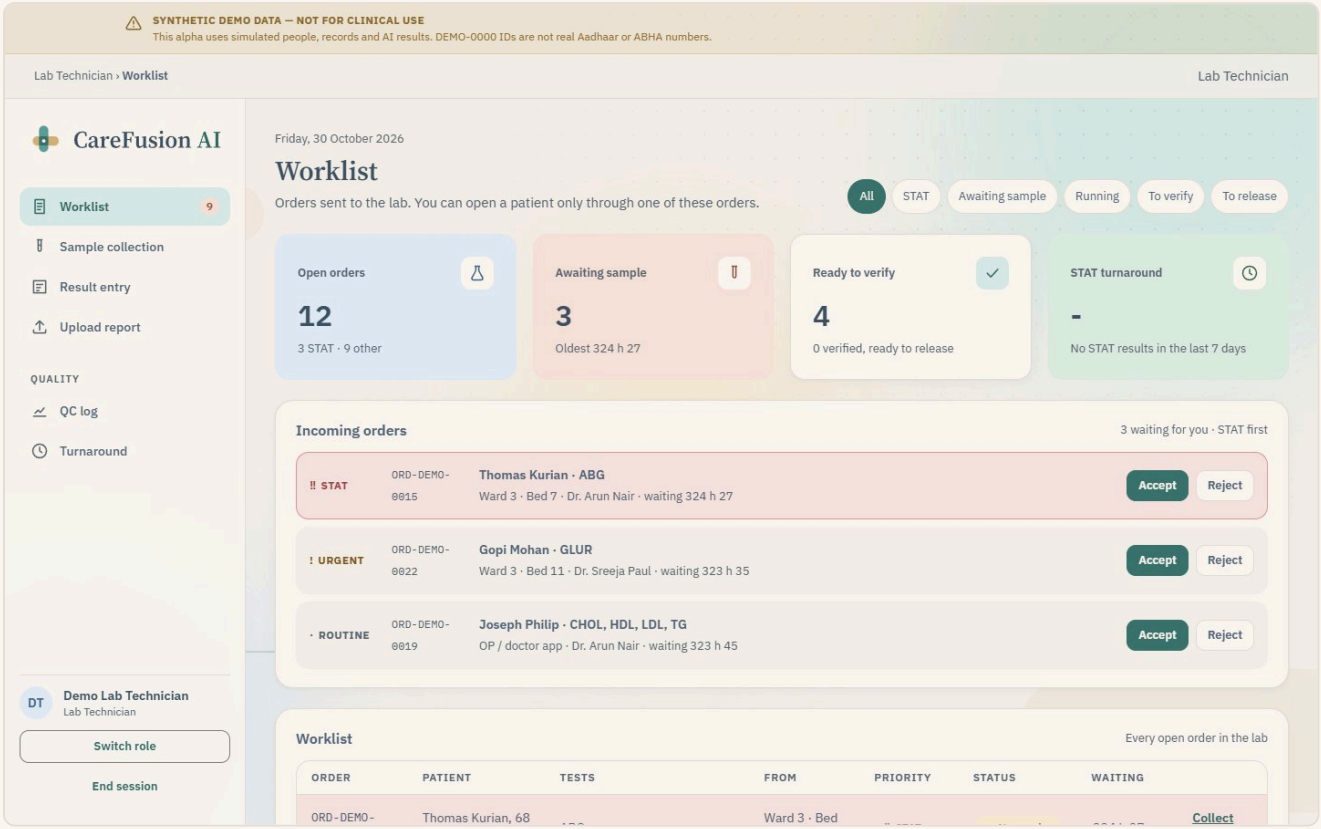

Screenshot of `/nurse?section=handover`

LAB-1

Work the lab list by stage

As a lab technician, **I want** a worklist of orders grouped by stage **so that** urgent samples are handled first.

- Counts for open orders, STAT orders, awaiting sample and oldest waiting.
- Stages: new, awaiting sample, running, to verify, to release.
- Accept or reject an order, receive or reject a specimen (for example haemolysed).

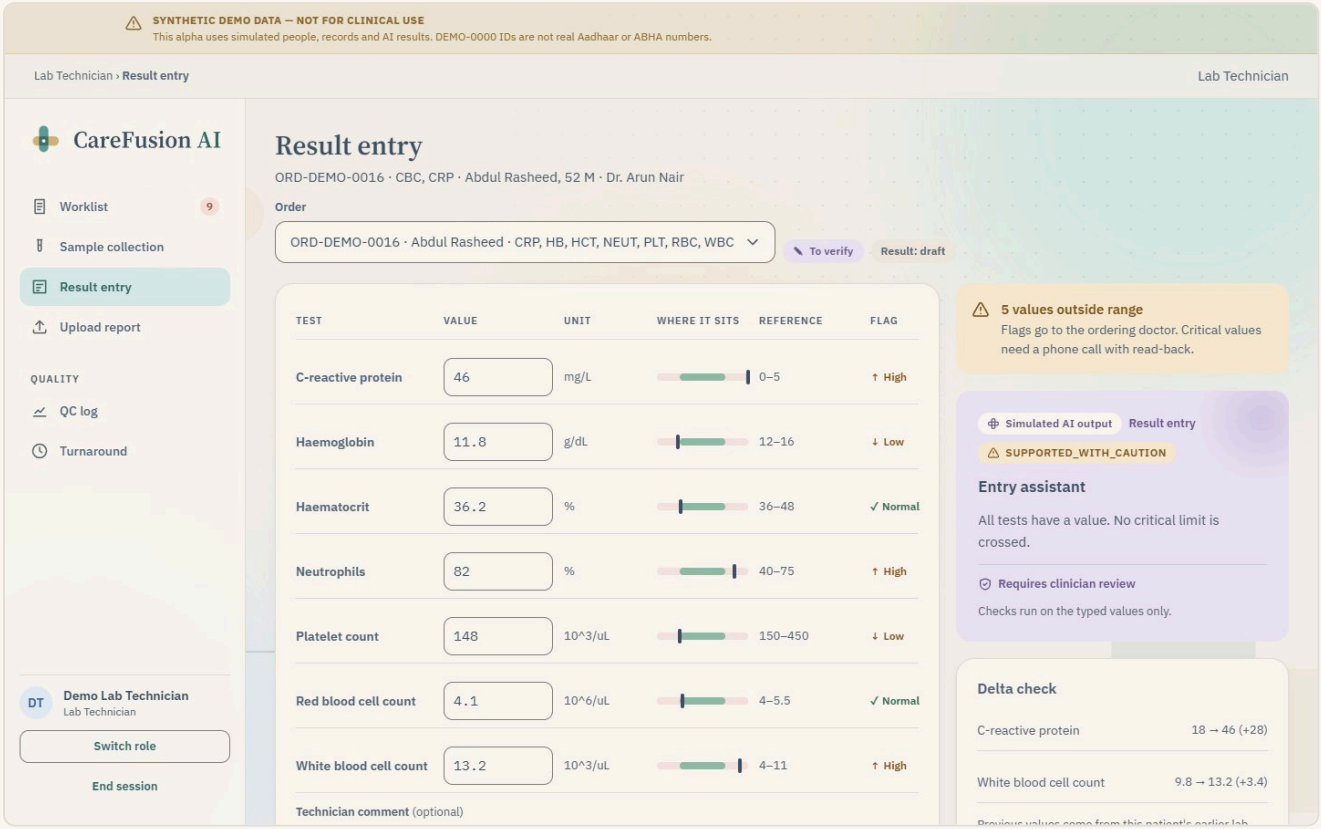

Screenshot of `/lab-tech`

LAB-2

Enter results with reference ranges and flags

As a lab technician, **I want** to enter values and have abnormal and critical results flagged **so that** doctors can trust and act on them.

- Each test shows its reference range and the previous value. High, low and critical flags are computed.
- A released result is locked. The ordering doctor and the citizen are notified.
- A critical value is called to the doctor first, with a read-back confirmation logged (for example potassium 6.1).

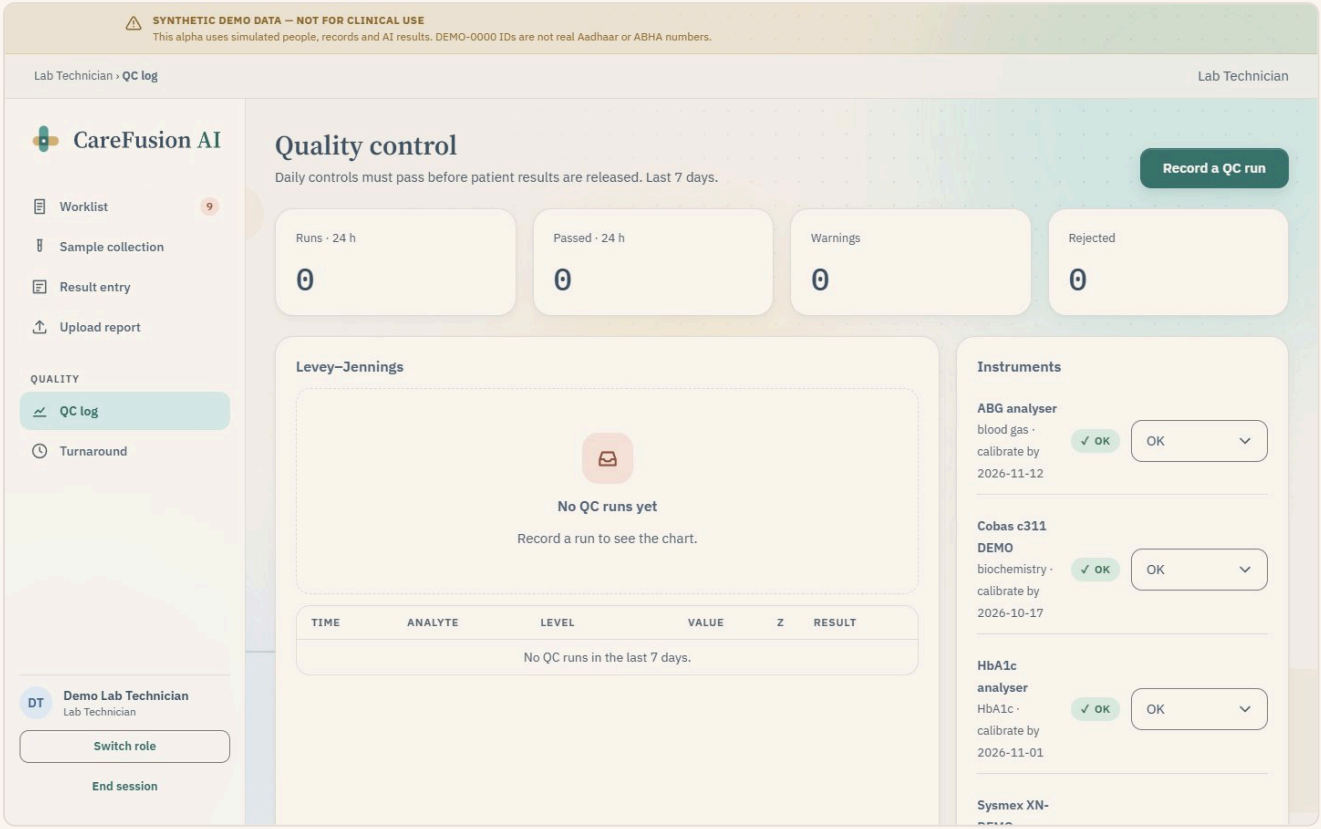

Screenshot of `/lab-tech?section=results`

LAB-3

Keep the analysers honest

As a lab technician, **I want** quality-control runs checked against Westgard rules **so that** bad runs are caught before results go out.

- Levey-Jennings style history per test and level.
- A run that breaks a rule is flagged and rejected.
- Instrument status, reagent lots and turnaround times are tracked.

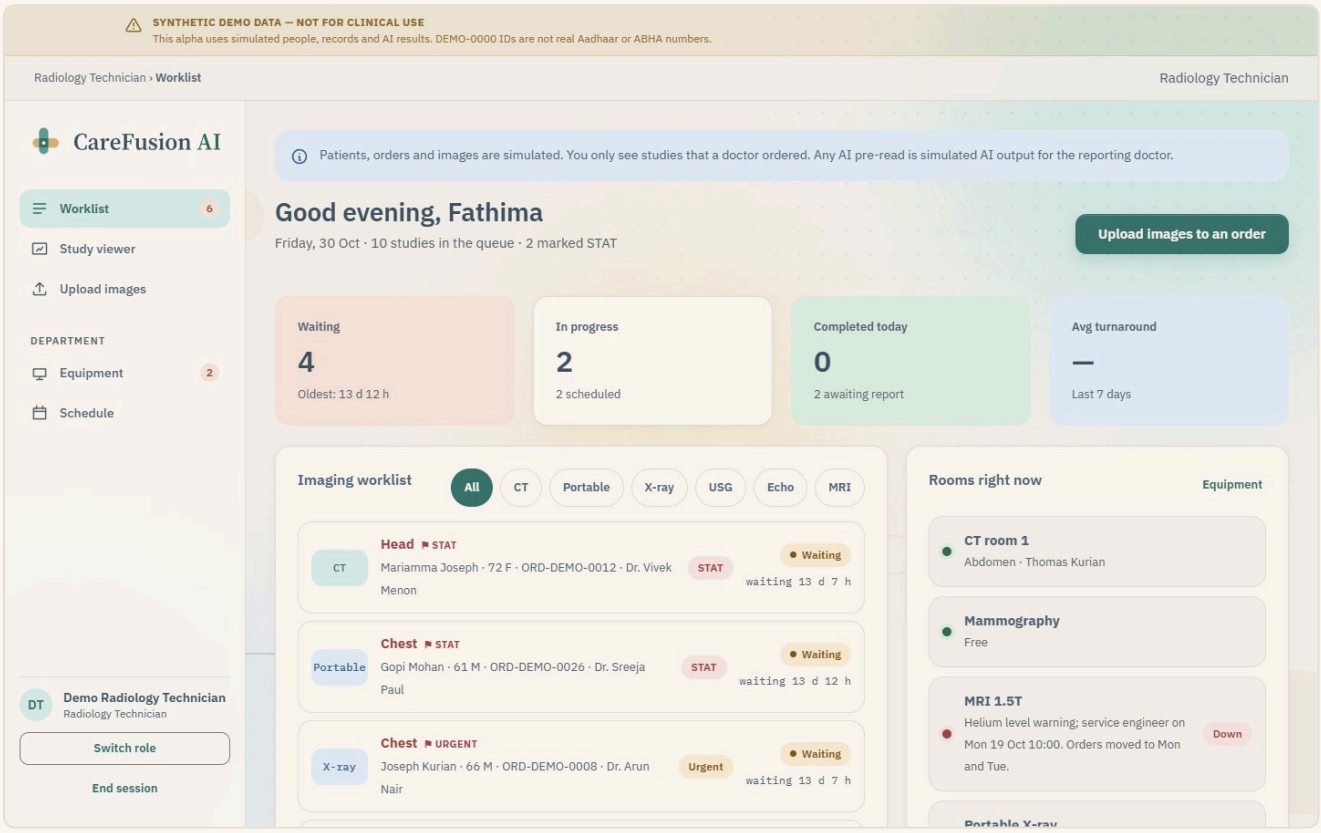

Screenshot of `/lab-tech?section=qc`

RAD-1

See which studies are waiting

As a radiology technician, **I want** a worklist of imaging orders by priority and modality **so that** urgent scans are done first.

- Orders from doctors appear with priority, modality and waiting time.
- Accept an order to create the study, or reject it with a reason.
- Statuses: waiting, scheduled, in progress, uploaded, reported.

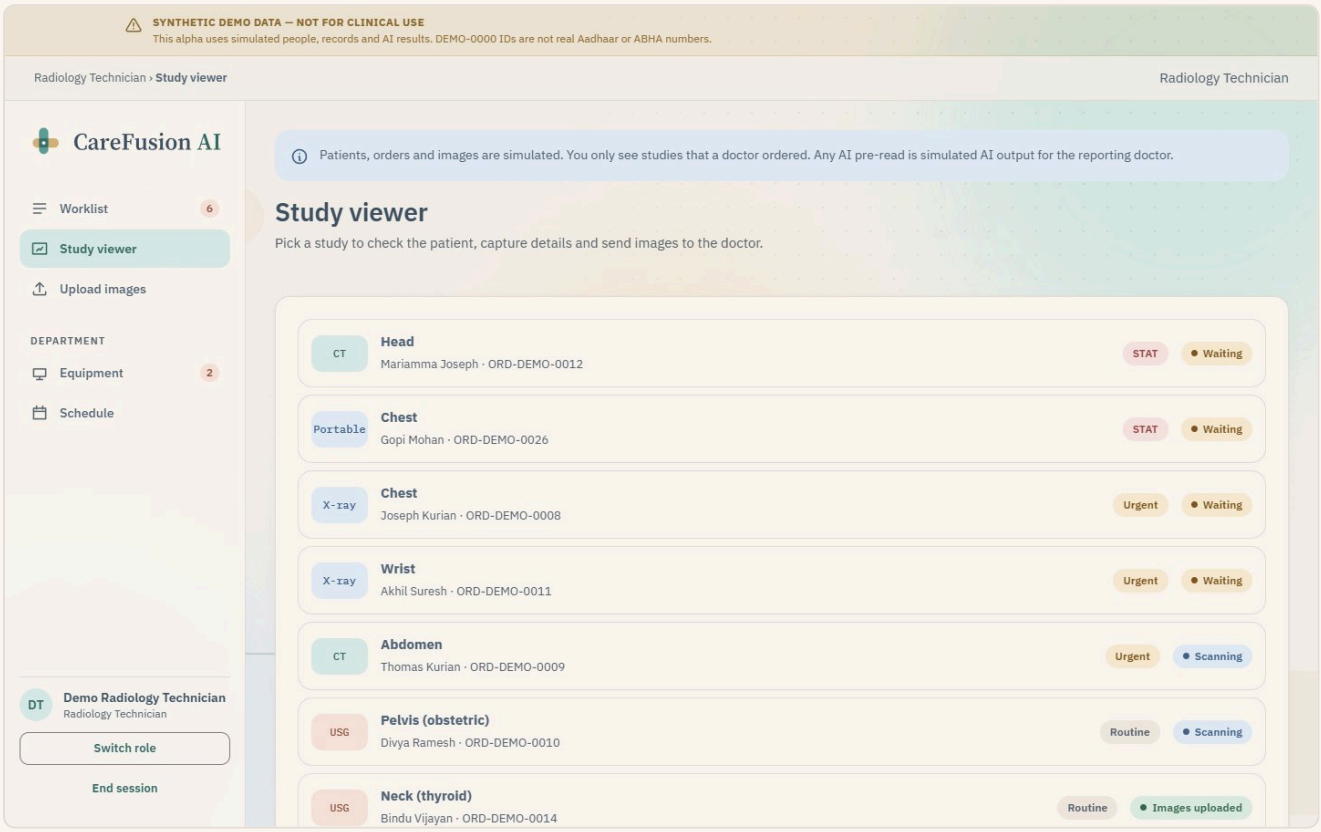

Screenshot of `/radiology-tech`

RAD-2

Capture a study safely

As a radiology technician, **I want** a checklist, an exposure log and a way to attach images **so that** the right patient is imaged correctly and safely.

- A safety checklist must be completed before submit.
- Exposure is logged. A wrong-patient upload can be withdrawn within 24 hours, with a reason.
- A prior study can be linked, but only for the same patient.
- A simulated AI pre-read is shown and labelled as such.

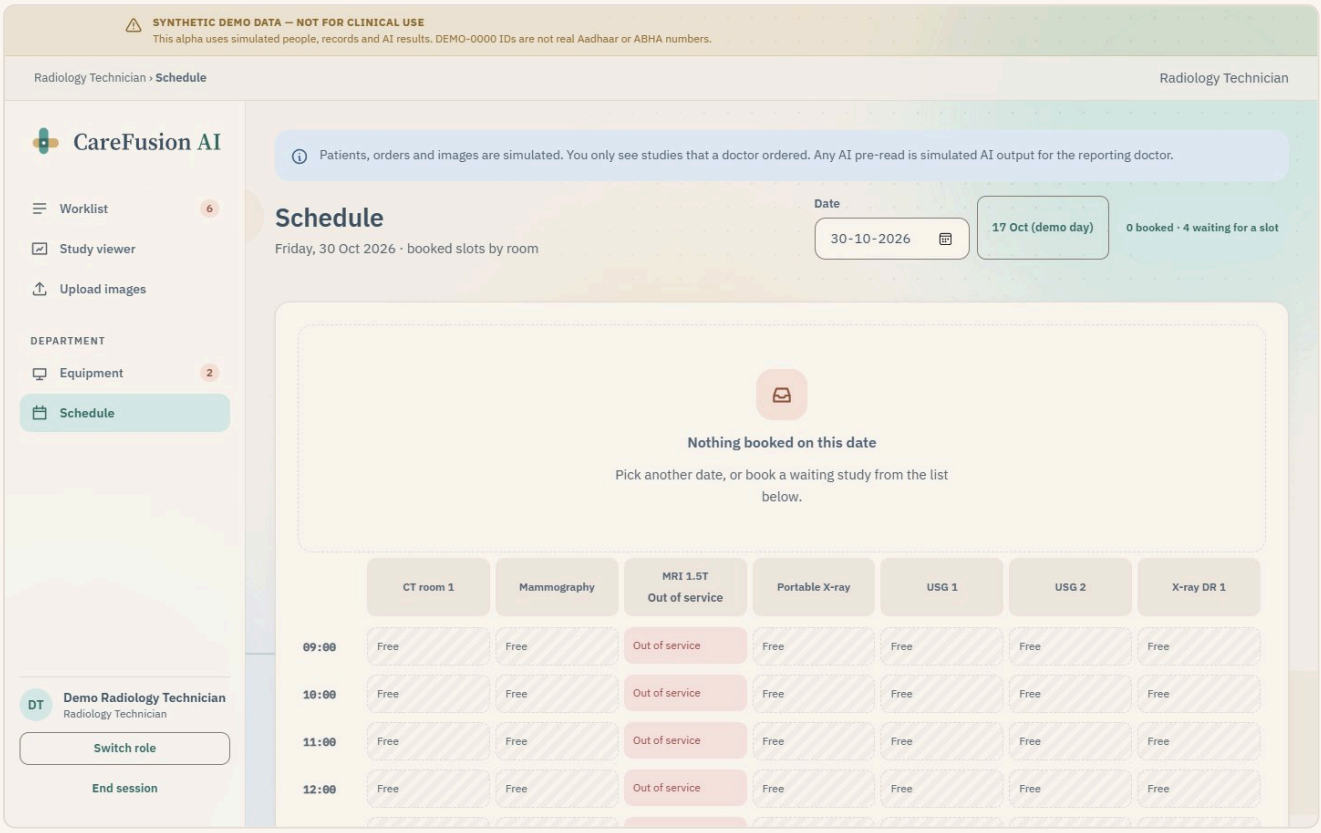

Screenshot of `/radiology-tech?section=study`

RAD-3

Plan the rooms

As a radiology technician, **I want** a room schedule and equipment status **so that** no room is double-booked and faults are visible.

- Rooms such as X-ray, CT, ultrasound and MRI with a day schedule.
- A double-booked slot is refused.
- Equipment events and downtime are logged.

Screenshot of `/radiology-tech?section=schedule`

Pharmacist and pharmacy admin

The pharmacy side turns a signed prescription into medicine in the patient's hands, while keeping stock, expiry and recalls under control. The demo pharmacist is Joseph Mathew and the pharmacy admin is Suma Thomas at Demo Hospital Pharmacy.

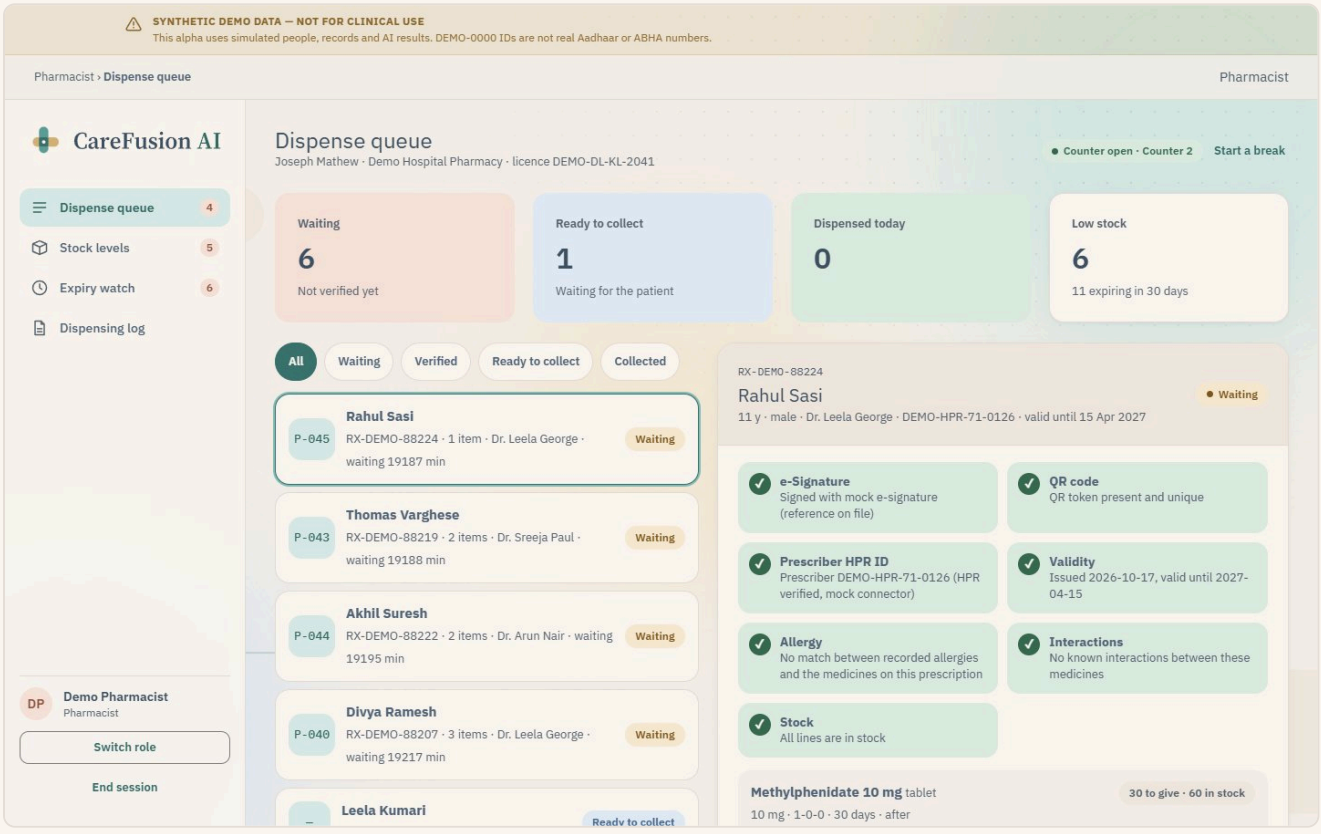

Try it: open /demo-signin and choose Pharmacist, then Pharmacy admin.

PHA-1

Verify and dispense a prescription

As a pharmacist, **I want** a queue of prescriptions with automatic safety checks **so that** I give the right medicine and catch problems.

- Seven checks per prescription: e-signature, QR, prescriber HPR ID, validity, allergy, interactions and stock.
- Dispense from the earliest-expiry batch first. Using another batch needs a written reason.
- Offer a substitute, mark an item out of stock, or close a partly dispensed prescription.
- A handover code (QR) confirms the right person collects. The citizen sees "Ready to collect".

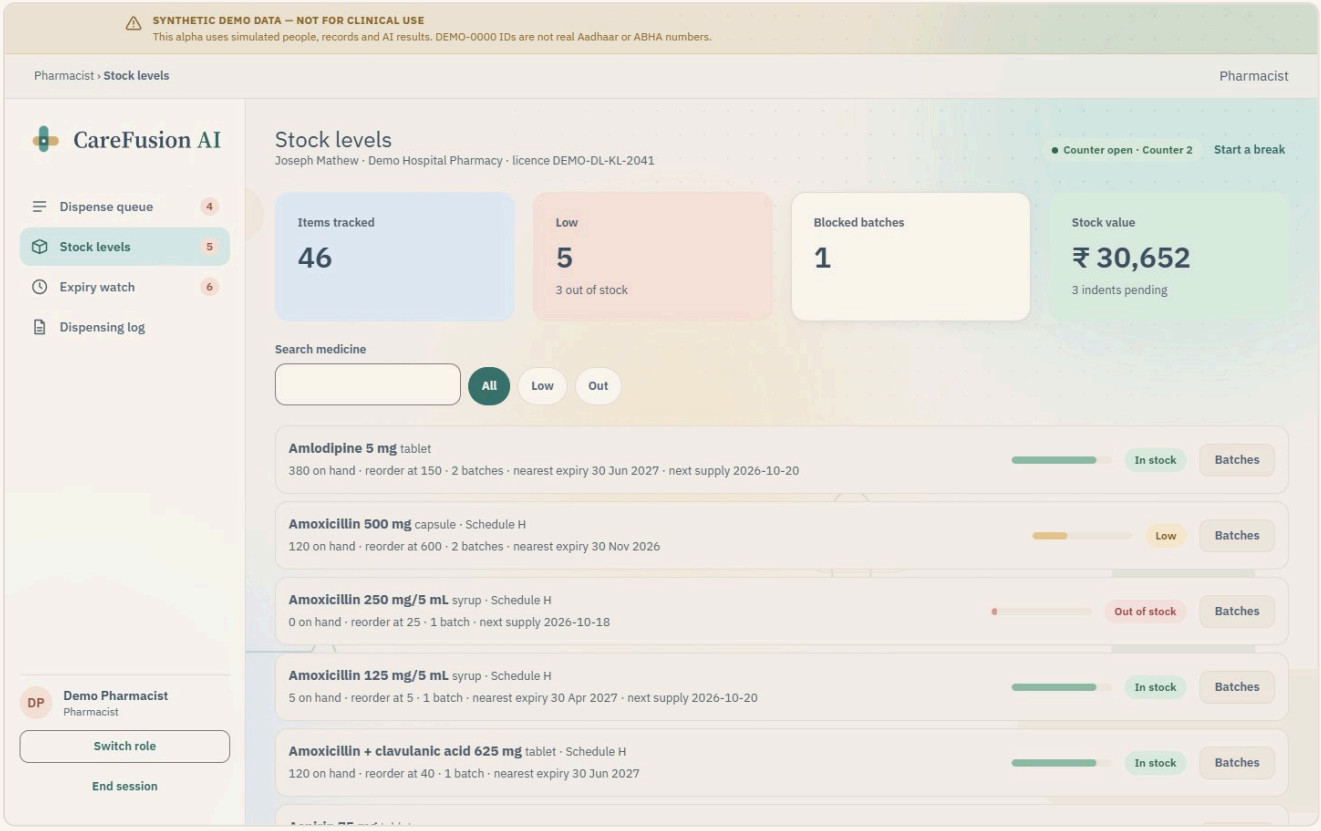

Screenshot of `/pharmacist`

PHA-2

Know what is low and manage a batch

As a pharmacist, **I want** stock levels by medicine with batch details and actions **so that** I reorder in time and block a bad batch.

- Levels in stock, low or out, with reorder points and next supply.
- Per batch: quarantine, return to supplier, write off or correct the count, each with a reason that is audited.
- Ward requests from nurses can be issued or declined.

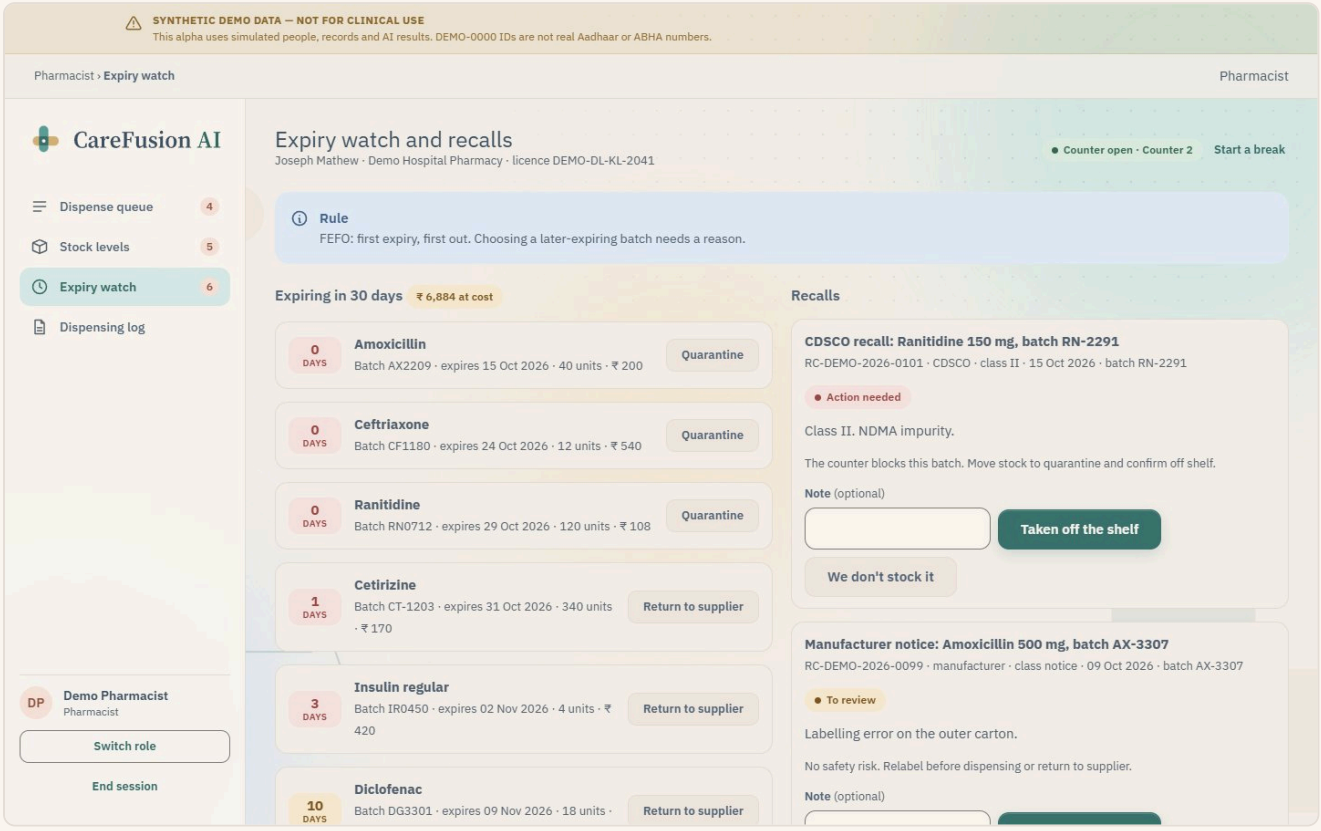

Screenshot of `/pharmacist?section=stock`

PHA-3

Act on expiry and recalls

As a pharmacist, **I want** to see batches near expiry and confirm recall notices **so that** expired or recalled stock never reaches a patient.

- Batches expiring in 30 days and in 31 to 90 days, with value at cost and a suggested action.
- Recall notices show the batch, class and reason. Confirming takes the batch off the shelf.

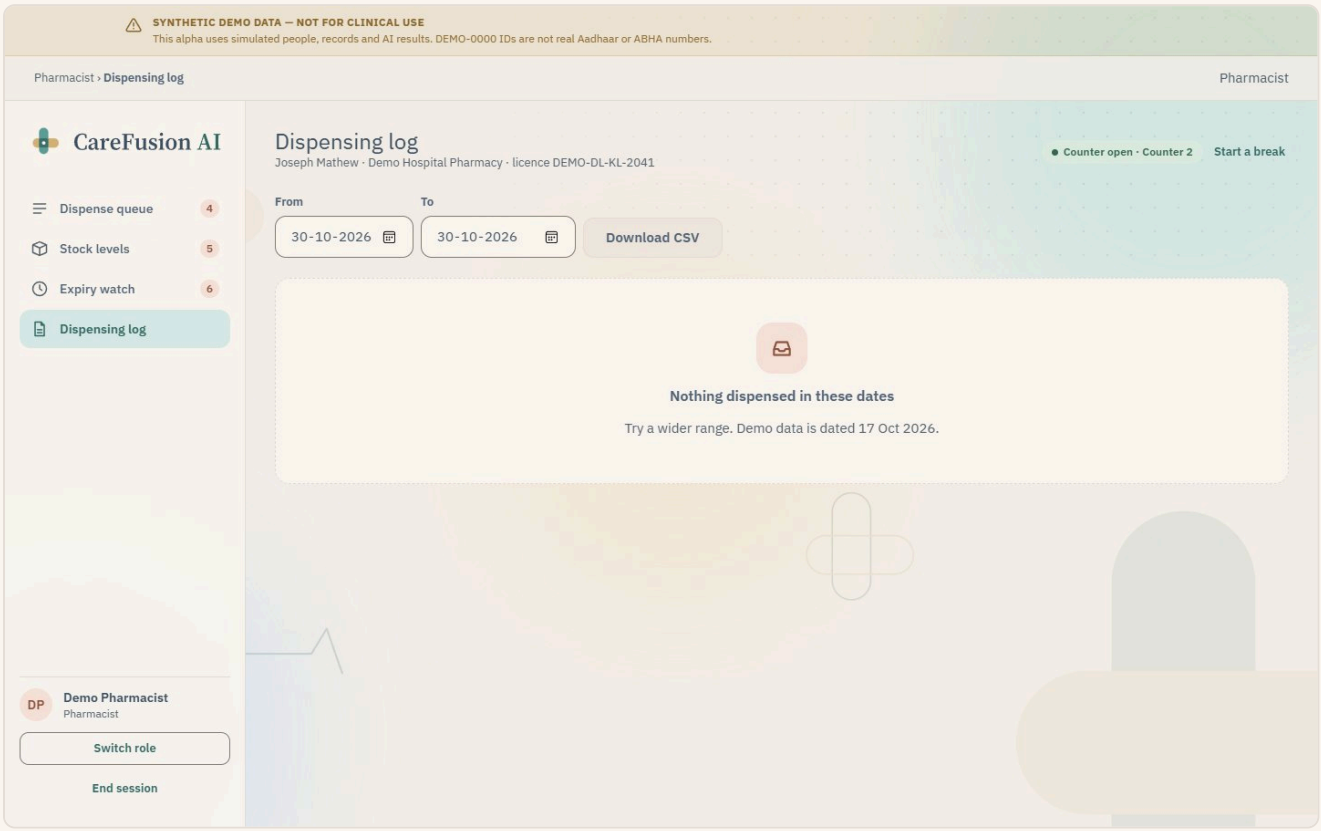

Screenshot of `/pharmacist?section=expiry`

PHA-4

Keep a complete dispensing log

As a pharmacist, **I want** a date-range log of everything I dispensed that I can download **so that** an inspector or auditor can see exactly what happened.

- Time, prescription, medicine, outcome, quantity, batch and who dispensed.
- Controlled drugs (Schedule X and H) also go into a separate register.
- CSV download for a date range.

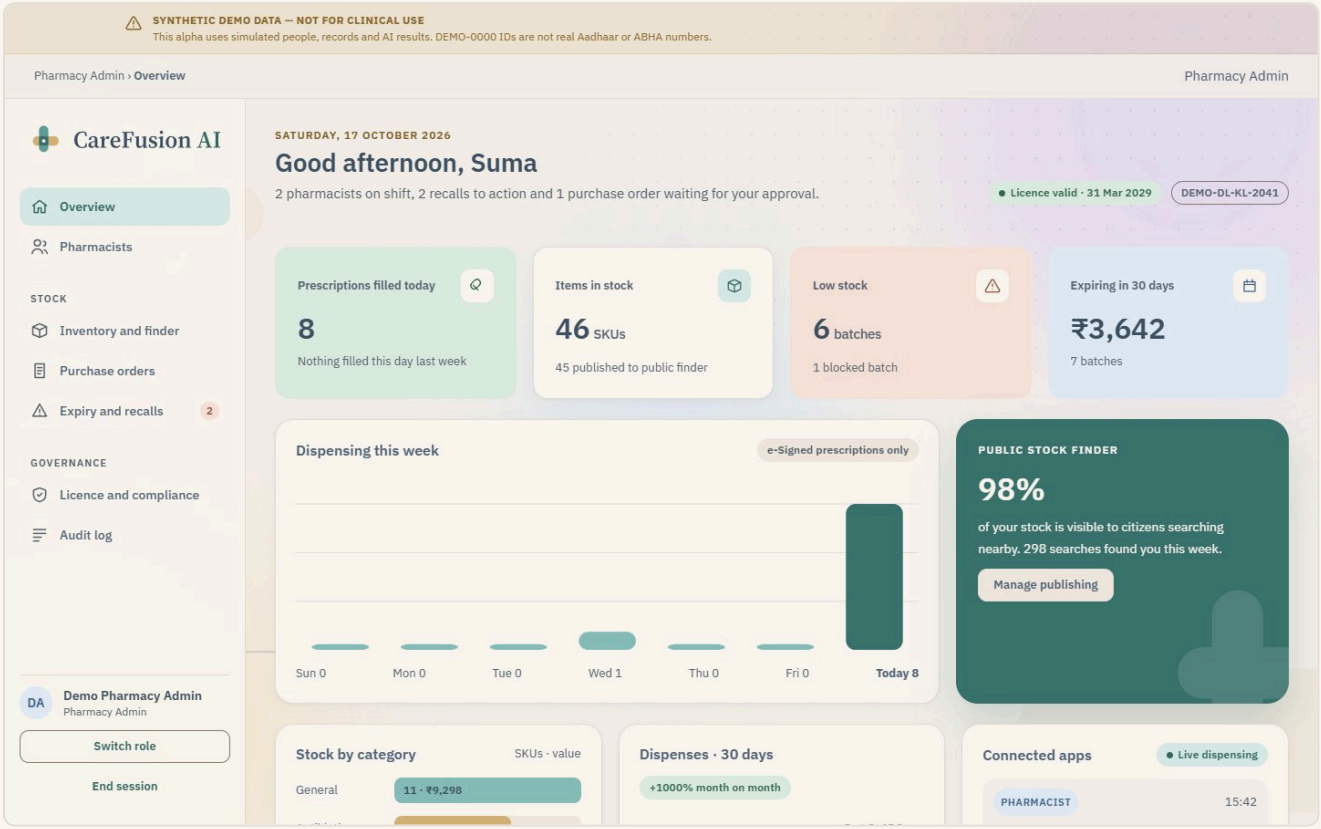

Screenshot of `/pharmacist?section=log`

PAD-1

Run the pharmacy from one overview

As a pharmacy admin, **I want** an overview of dispensing, stock and what needs my action **so that** I spend my time where it matters.

- Dispensing for the week, stock by category and pharmacists on shift.
- A needs-action list: recalls, purchase orders to approve, staff invites, documents about to lapse.
- Licence status and number are always visible.

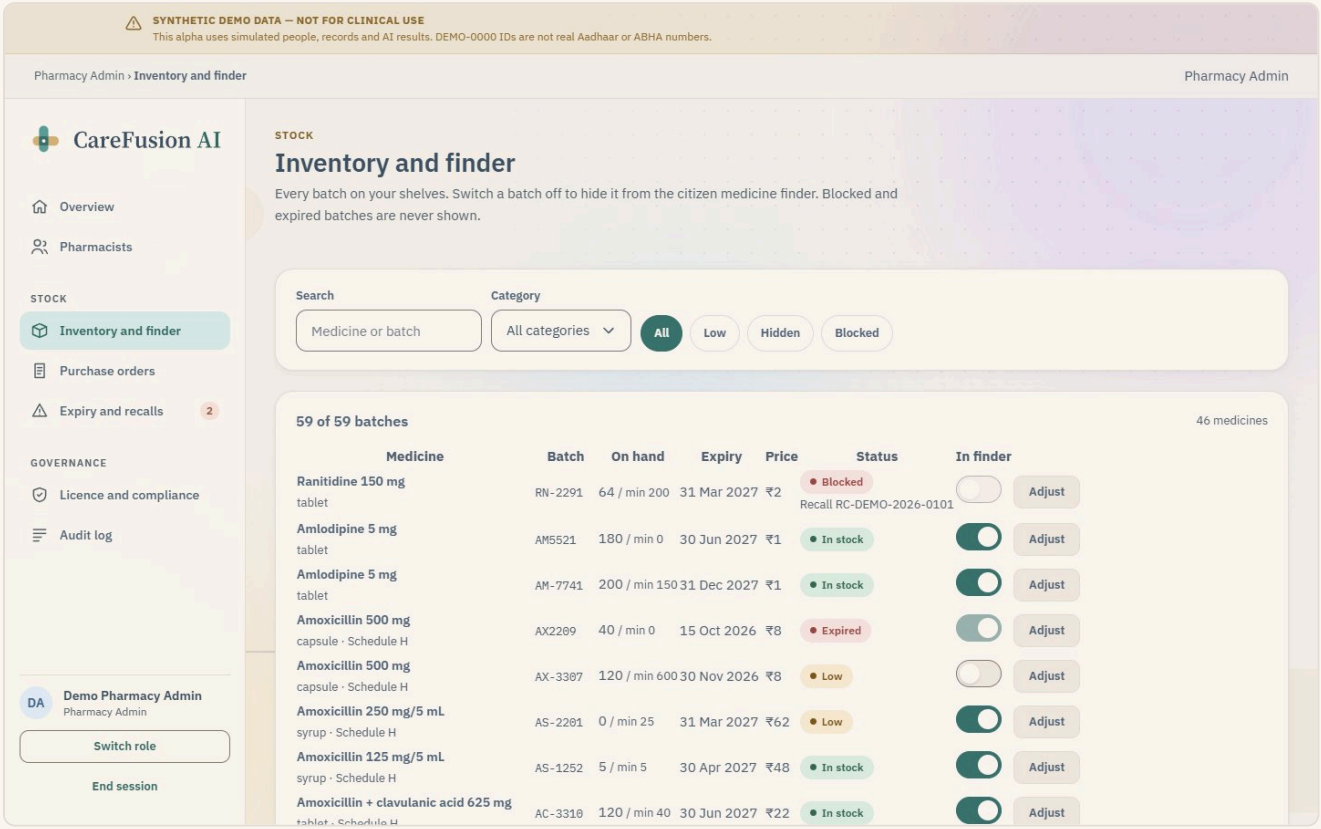

Screenshot of `/pharmacy-admin`

PAD-2

Control what citizens can find

As a pharmacy admin, **I want** to switch each batch on or off in the public medicine finder **so that** citizens only see stock I can actually supply.

- Every batch with on-hand, minimum, expiry and price.
- Blocked or expired batches can never be published.
- Correct counts, write off or quarantine, always with a reason.

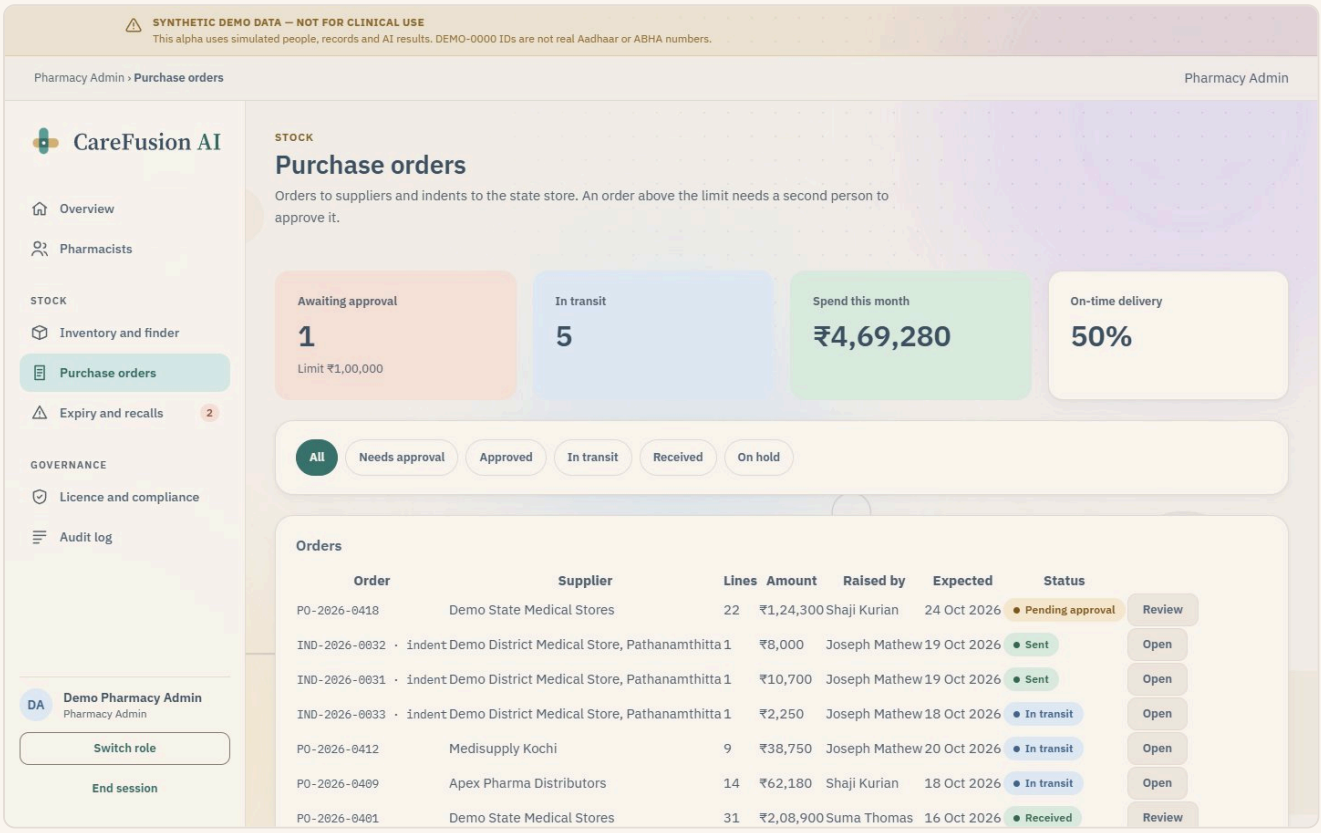

Screenshot of `/pharmacy-admin?section=inventory`

PAD-3

Approve purchases with a second person

As a pharmacy admin, **I want** purchase orders with a limit and an approval step **so that** no one can commit large spend alone.

- Orders above the approval limit wait for approval, and the person who raised one cannot approve it.
- See lines, totals, supplier and expected date. Approve or send back with a reason.
- Indents to the state store are listed beside normal orders.

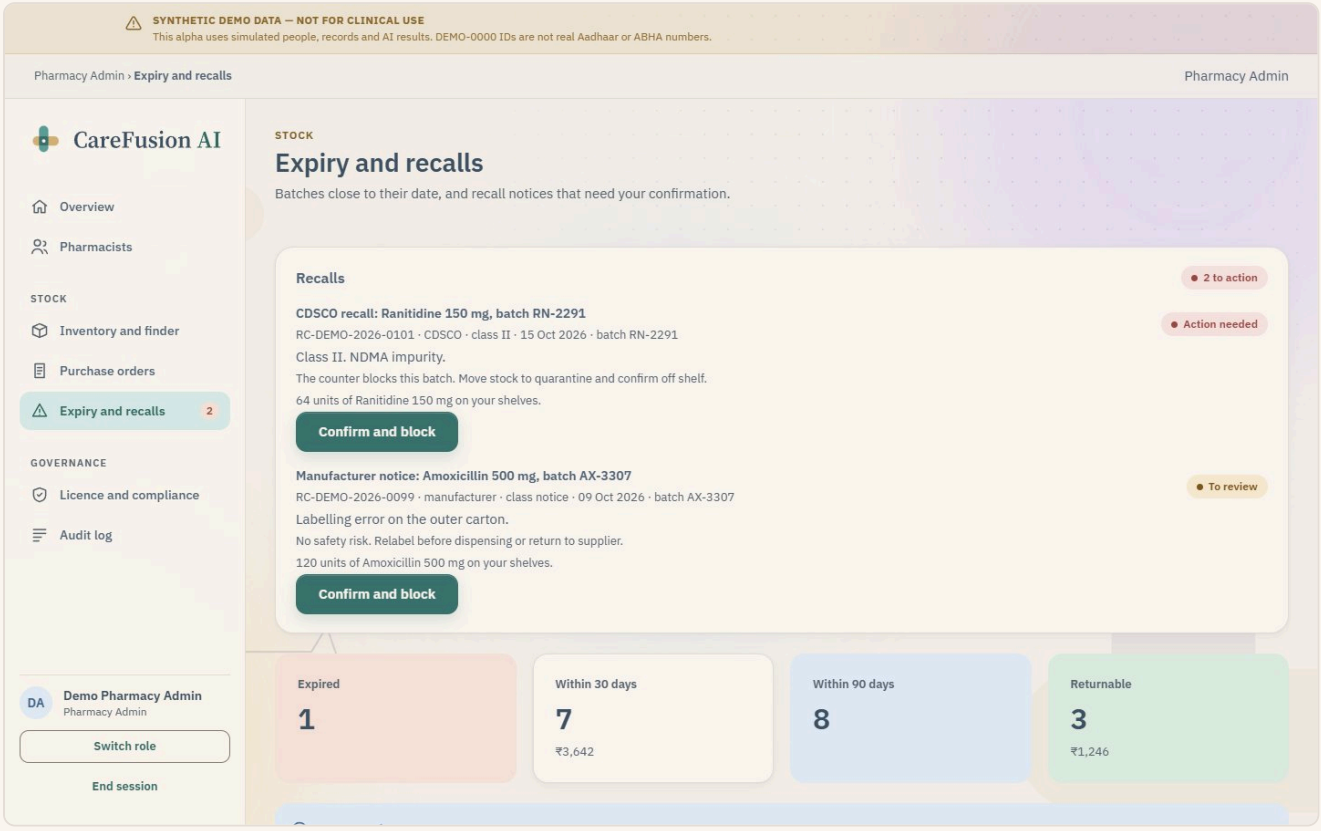

Screenshot of `/pharmacy-admin?section=orders`

PAD-4

Stay on top of expiry and recalls

As a pharmacy admin, **I want** a single view of expiring stock and recall actions **so that** I protect patients and avoid waste.

- Counts for expired, 30 days and 90 days with a value, plus what can be returned.
- Confirming a recall blocks matching batches and hides them from the finder. It can be undone.

Screenshot of `/pharmacy-admin?section=expiry`

Hospital admin

The hospital admin runs the hospital's people and capacity, answers complaints and reviews every emergency access. The demo admin is Dr. Meera Krishnan at Demo General Hospital. Numbers on these screens are computed from the data, not typed in.

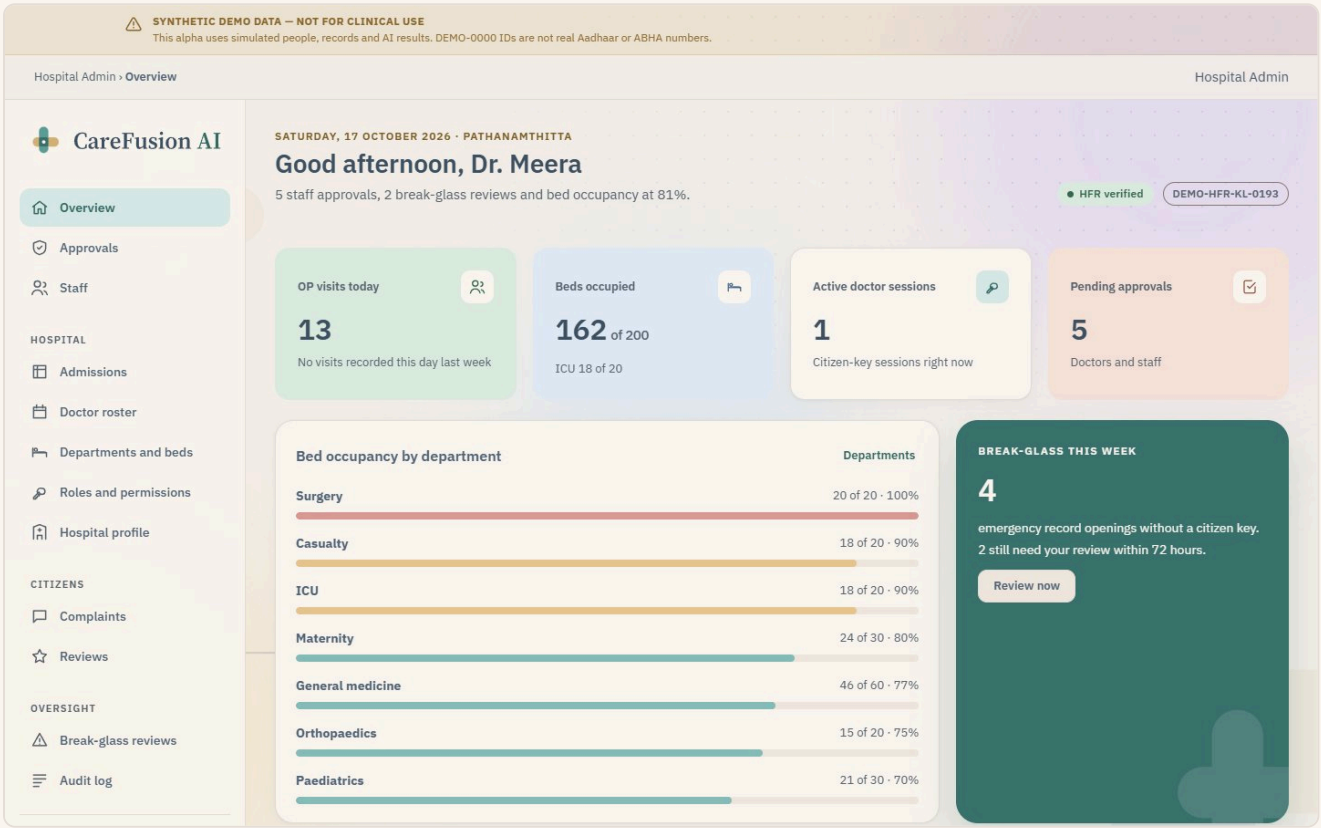

Try it: open /demo-signin and choose Hospital admin.

HAD-1

See the hospital's state at a glance

As a hospital admin, **I want** an overview of beds, staff on duty, approvals and emergency reviews **so that** I notice problems early.

- Bed occupancy by department (162 of 200 in service).
- Break-glass uses waiting for my review, an approval queue and recent activity.
- Open complaints and the hospital's rating summary.

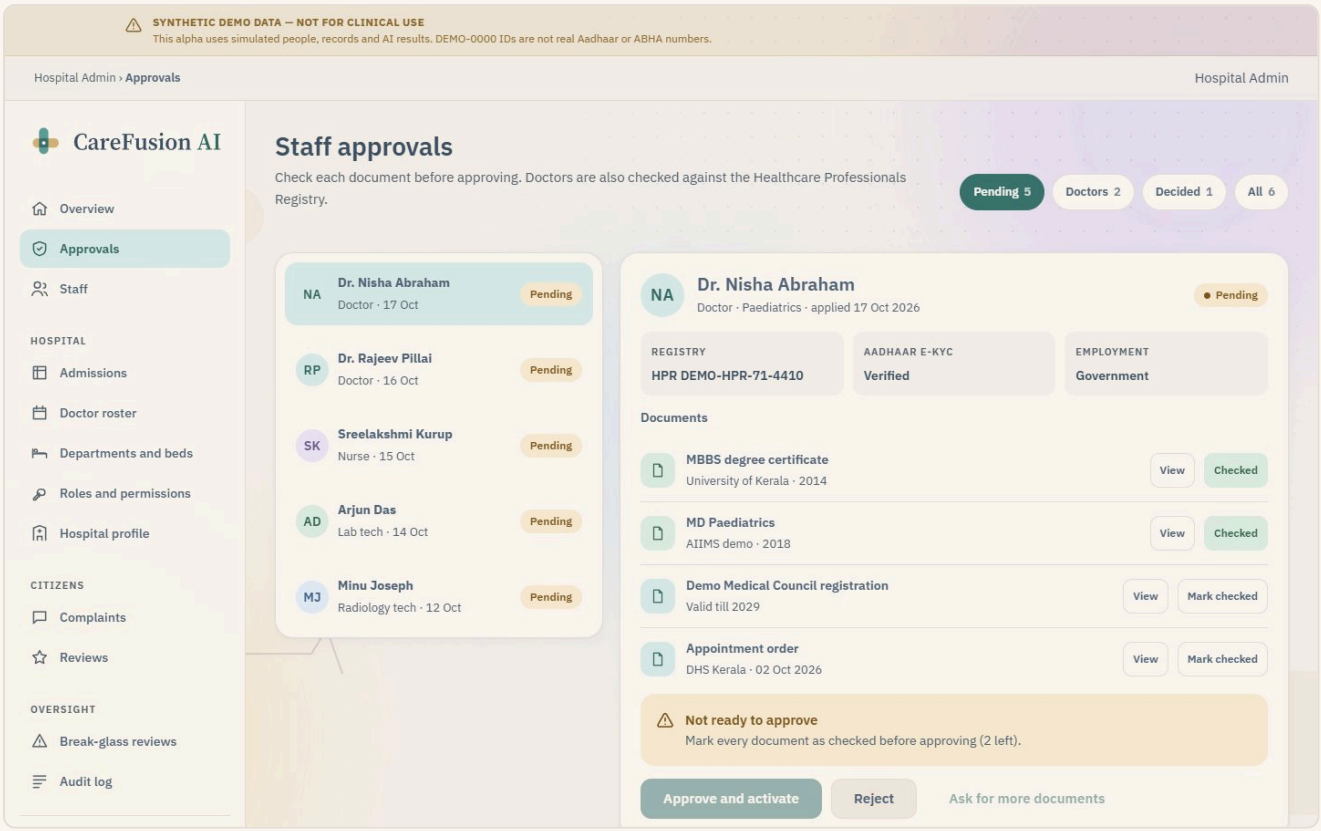

Screenshot of /hospital-admin

HAD-2

Approve new doctors and staff

As a hospital admin, **I want** to check an applicant's documents and approve or reject them **so that** only verified people get an account.

- Each applicant's documents are checked one by one. Approval is blocked until every document is checked and none has expired.
- Rejection needs a reason.
- Approved accounts are activated straight away.

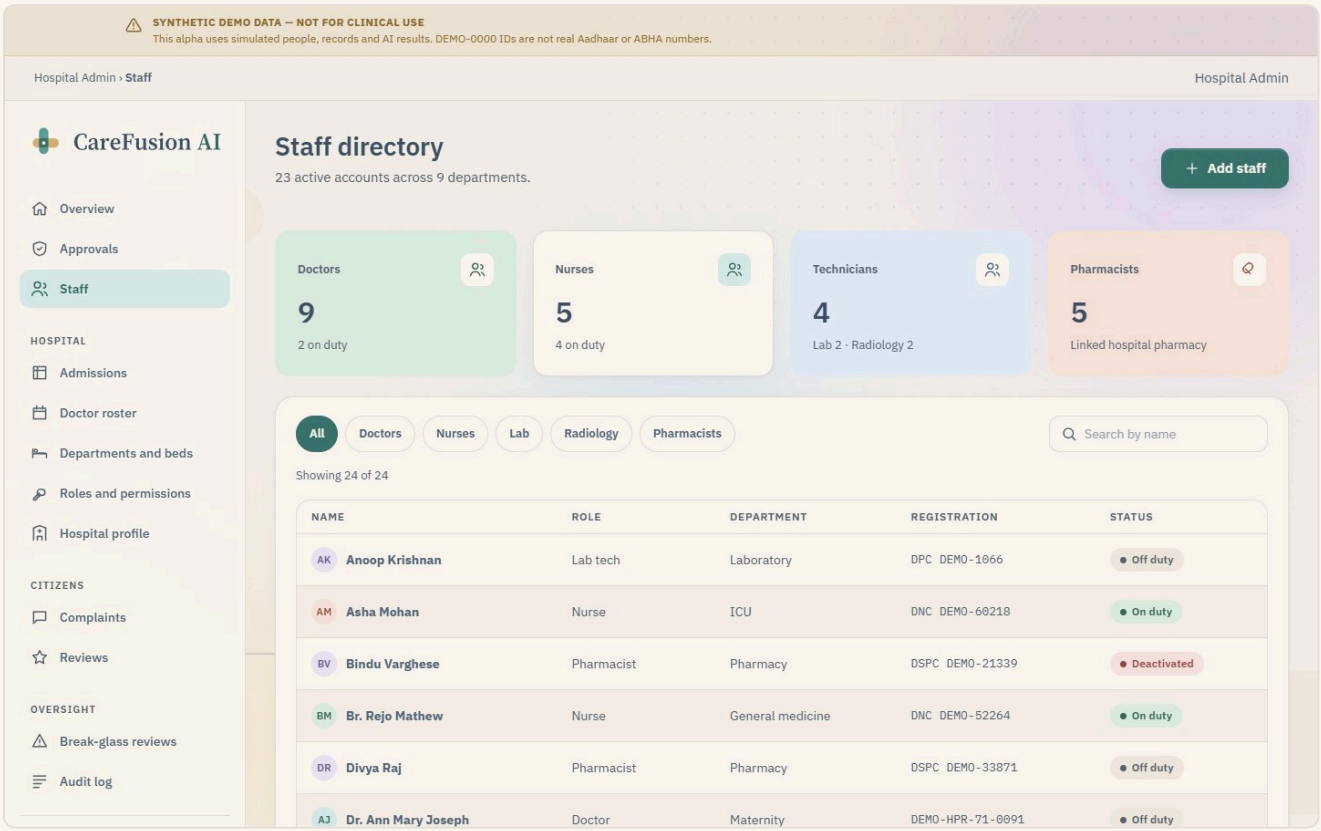

Screenshot of `/hospital-admin?section=approvals`

HAD-3

Create nurse, lab and radiology accounts

As a hospital admin, **I want** a staff list and a form to add staff **so that** my team can start work without delay.

- Staff by role and shift with registration numbers.
- Create a nurse, lab or radiology account for my own hospital only.
- A permission matrix shows what each role may do. Nationally locked rules cannot be changed.

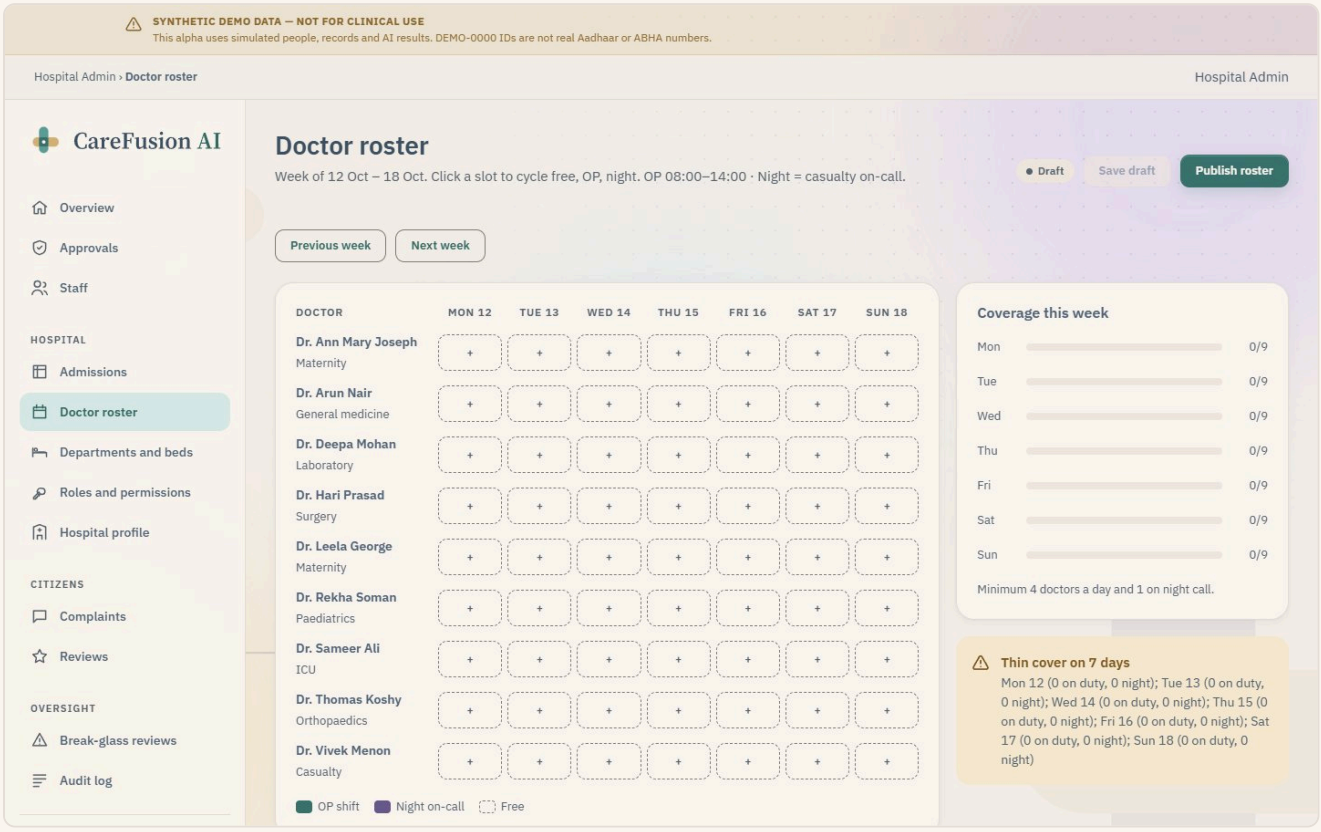

Screenshot of `/hospital-admin?section=staff`

HAD-4

Plan the doctor roster

As a hospital admin, **I want** a weekly roster with coverage warnings **so that** every department is covered.

- Week grid of doctors by day and shift.
- Thin coverage is flagged before I publish.
- A visiting doctor posted from another hospital can be added.

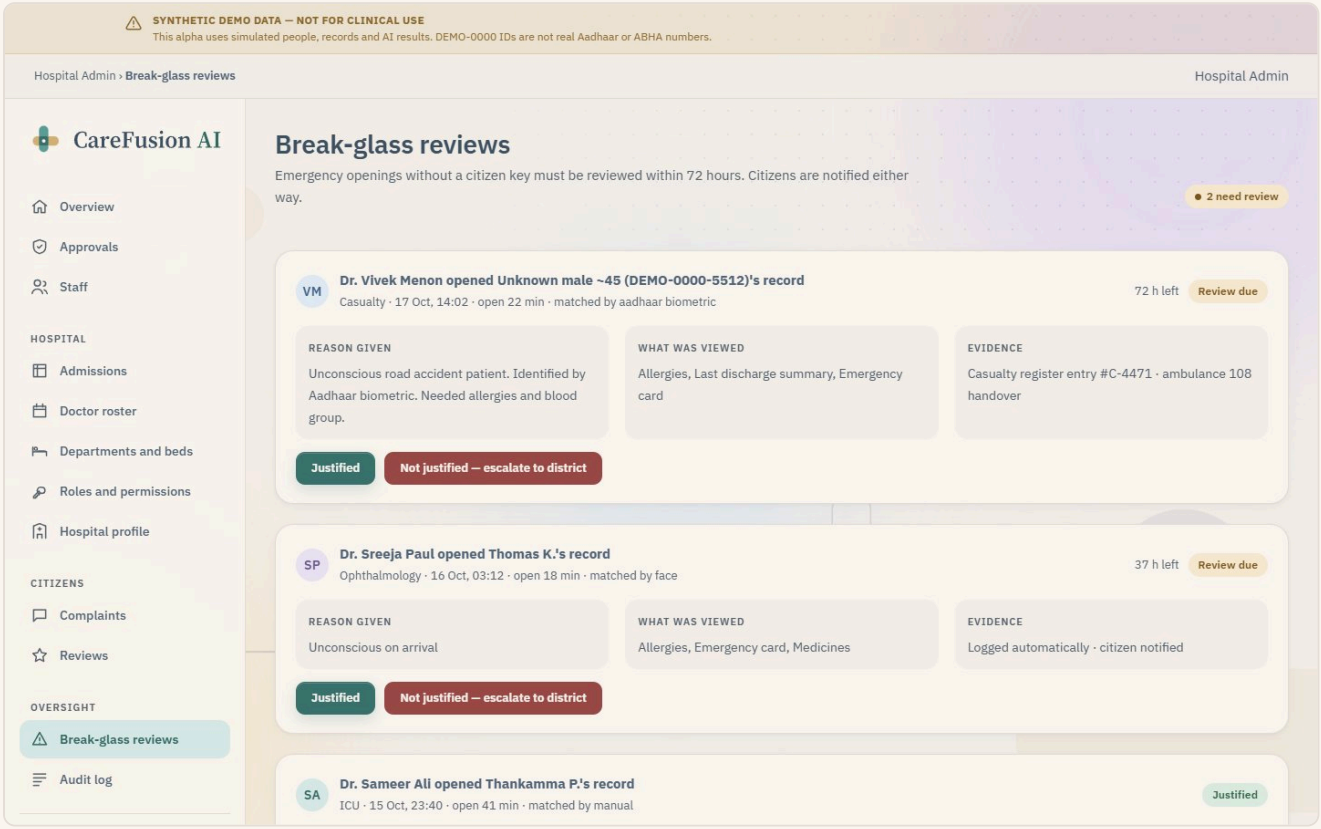

Screenshot of `/hospital-admin?section=roster`

HAD-5

Review every emergency access

As a hospital admin, **I want** a list of break-glass uses with reasons and a way to justify or escalate **so that** emergency access is never abused.

- Each row shows the doctor, patient, time, reason and second doctor.
- Justify a good use, or escalate a doubtful one to the district office.
- Once decided it cannot be re-justified.

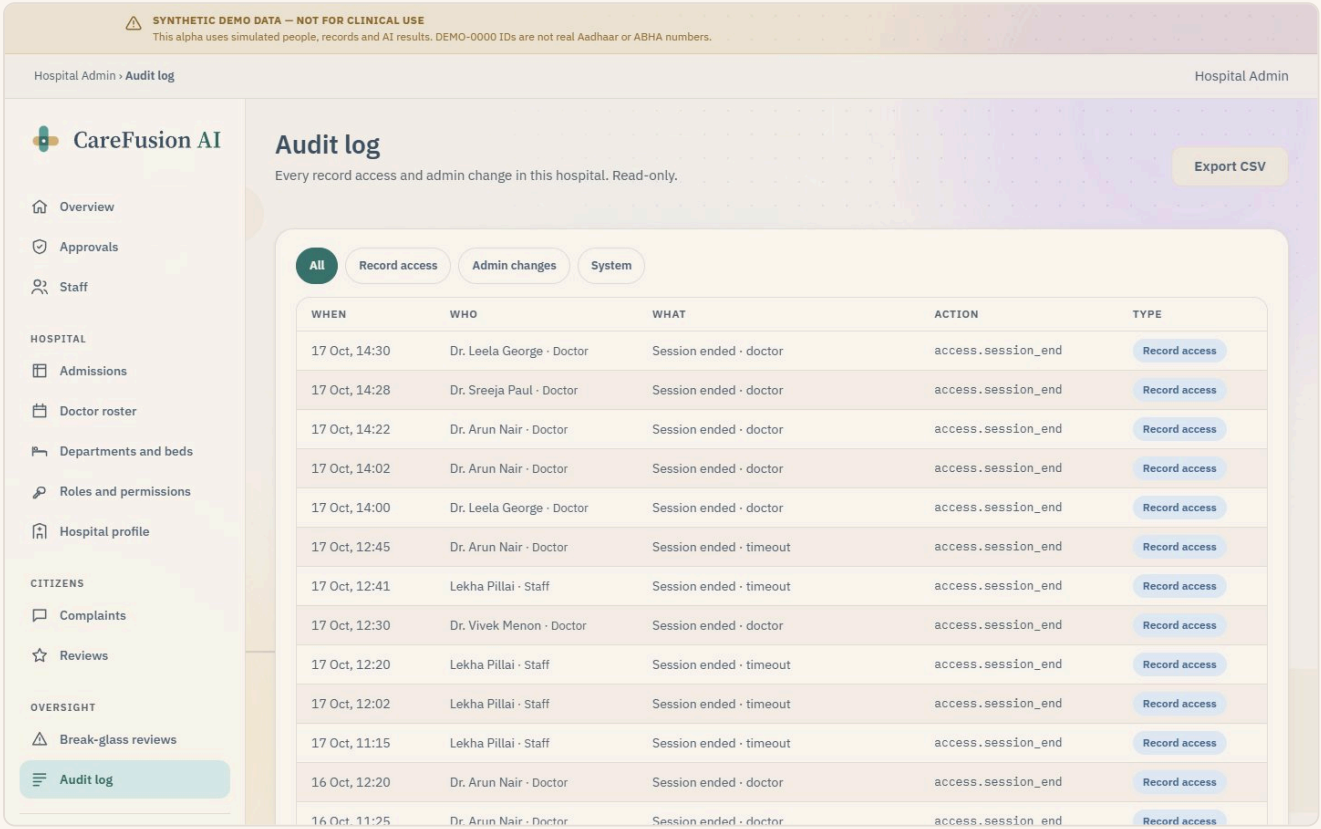

Screenshot of `/hospital-admin?section=breakglass`

HAD-6

Read an audit trail nobody can edit

As a hospital admin, **I want** a log of who opened what and what admins changed **so that** I can answer any question about access.

- Filter by access, admin and system events.
- Entries are chained so tampering is detectable.
- Patient names are not written into the details.

Screenshot of `/hospital-admin?section=audit`

Government consoles: district, state, zonal and central

Four levels share one console. The level and area come only from the signed-in admin's post, never from the address bar, so a district admin can never read another district. Government roles see counts and trends, never patient-level events. The demo admins are Ajay Kumar (Pathanamthitta), Latha Nair (Kerala), R. Venkatesh (South zone) and S. Banerjee (India).

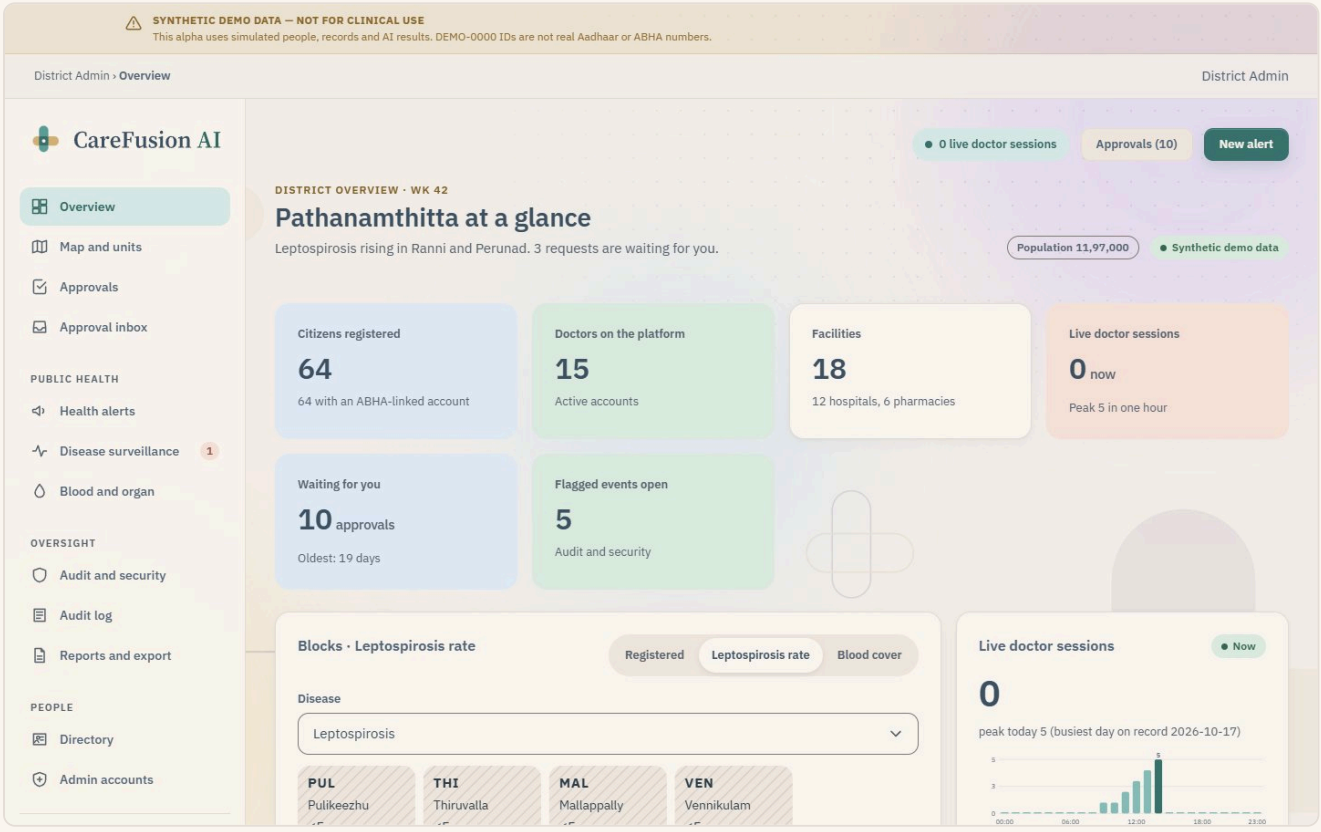

Try it: open /demo-signin and choose each admin level in turn. Try AI governance as Central admin, then as District admin to see it is refused.

GOV-1

Understand my area at a glance

As a district admin, **I want** an overview of registrations, doctors, facilities, live sessions and what is waiting for me **so that** I know where to act.

- Headline: "Leptospirosis rising in Ranni and Perunad. 3 requests are waiting for you."
- Cards for citizens registered, doctors, facilities, live doctor sessions, approvals and flagged events.
- Population and week number are shown. Figures are computed from the data.

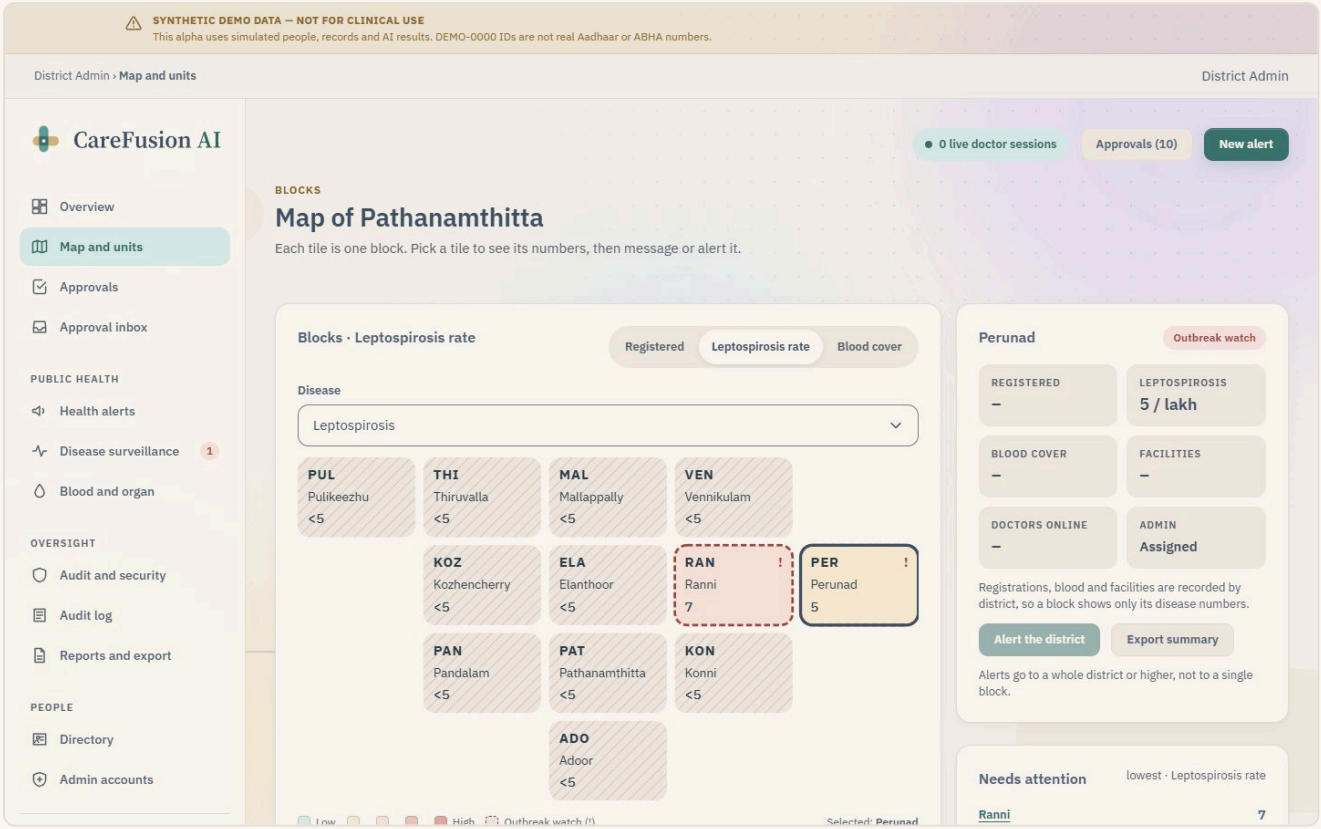

Screenshot of `/district-admin`

GOV-2

See hot spots on a map

As a district admin, **I want** a tile map of blocks with a switch between registrations, disease rate and blood cover **so that** I can spot where to send help.

- Tiles for each block, shaded by the chosen measure, with a text label as well as colour.
- Choose the disease from a list.
- Small counts below five are hidden to protect privacy.

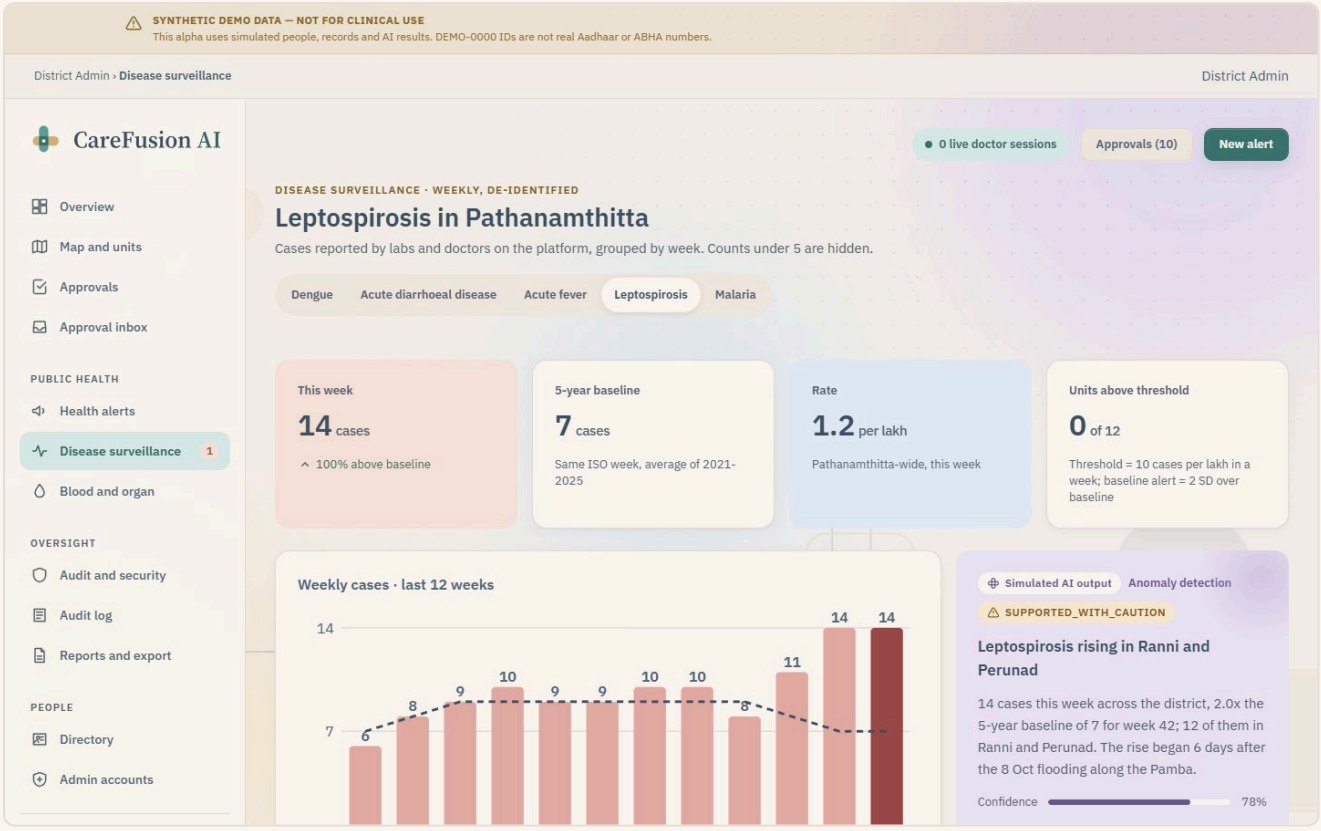

Screenshot of `/district-admin?section=map`

GOV-3

Catch an outbreak early

As a district admin, **I want** 12-week disease trends against a 5-year baseline, with flagged anomalies **so that** I act before it spreads.

- Series chart for each disease with the baseline.
- Anomalies are listed with a short narrative. I can review them, start a response action and request a field team.
- Only aggregated, de-identified counts are used.

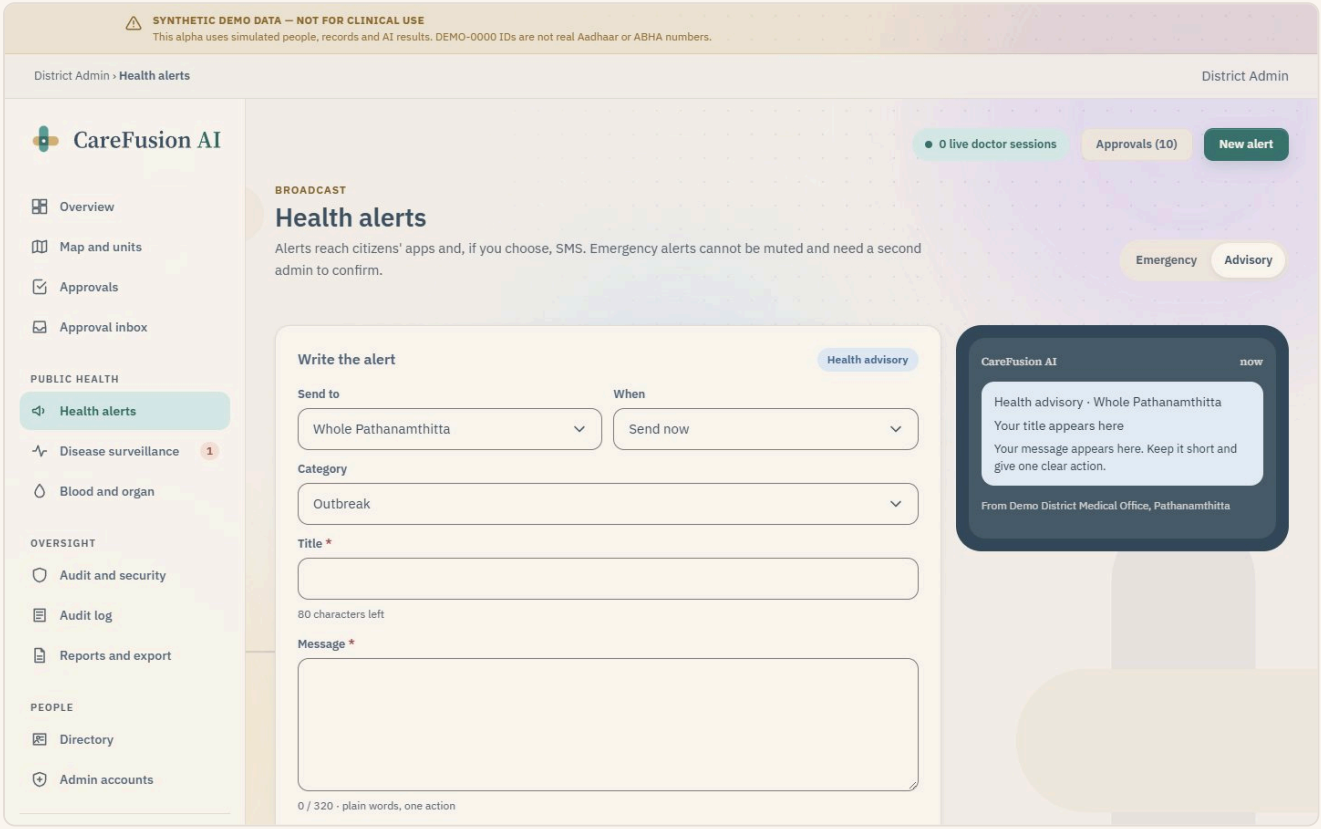

Screenshot of `/district-admin?section=surveillance`

GOV-4

Send a health alert people can trust

As a district admin, **I want** to compose an alert, preview its reach and send or schedule it **so that** the right people are warned at the right time.

- Advisory or emergency alerts, targeted to my area only.
- An emergency alert goes out only after a second admin approves it.
- The reach figure is computed before sending. Citizens see it in their alerts.

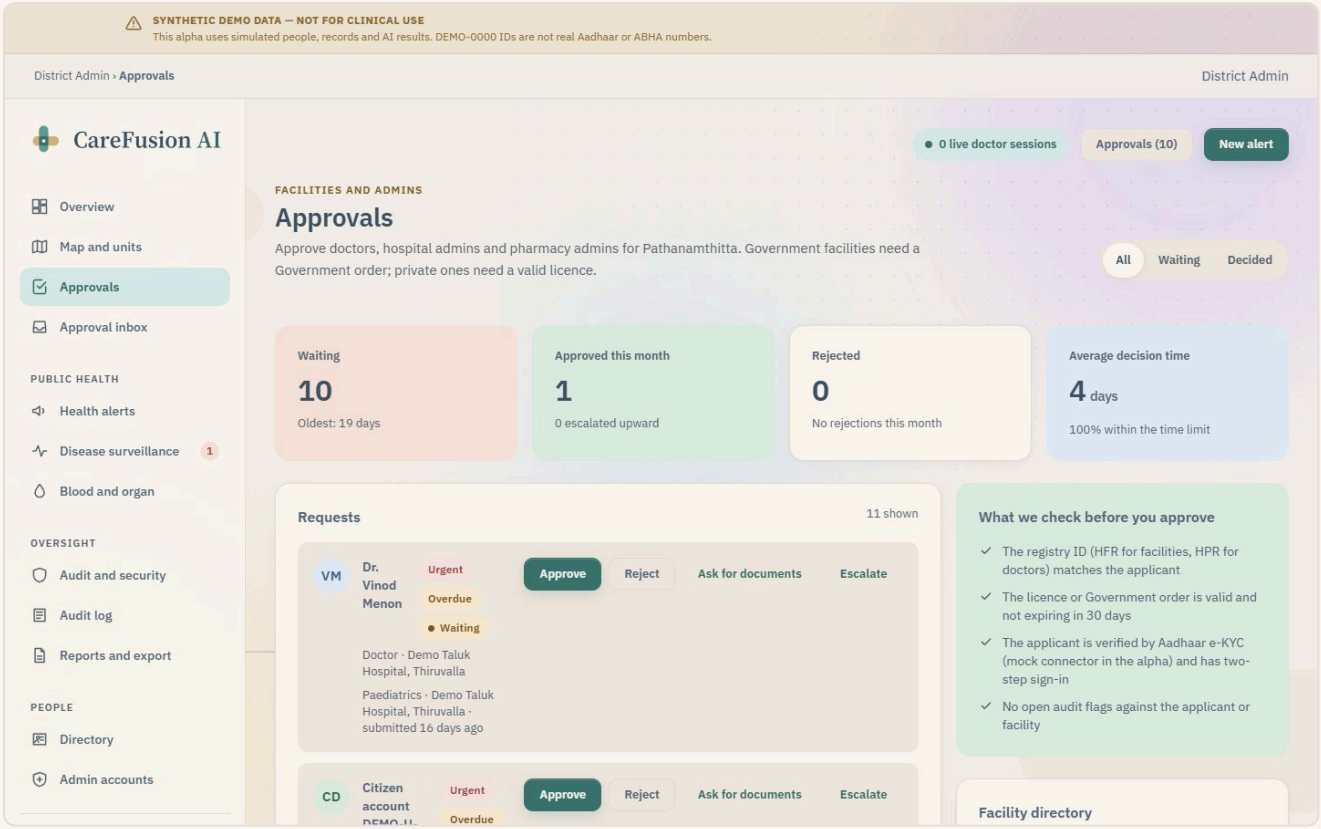

Screenshot of `/district-admin?section=alerts`

GOV-5

Decide on approvals with the right checks

As a district admin, **I want** an inbox of requests (hospitals, pharmacies, doctors, special categories) with automatic checks **so that** I approve quickly but not blindly.

- Approve, reject, ask for more information or escalate, each with a reason.
- Failed checks are shown clearly.
- Some requests need two different admins, so one person cannot approve alone.

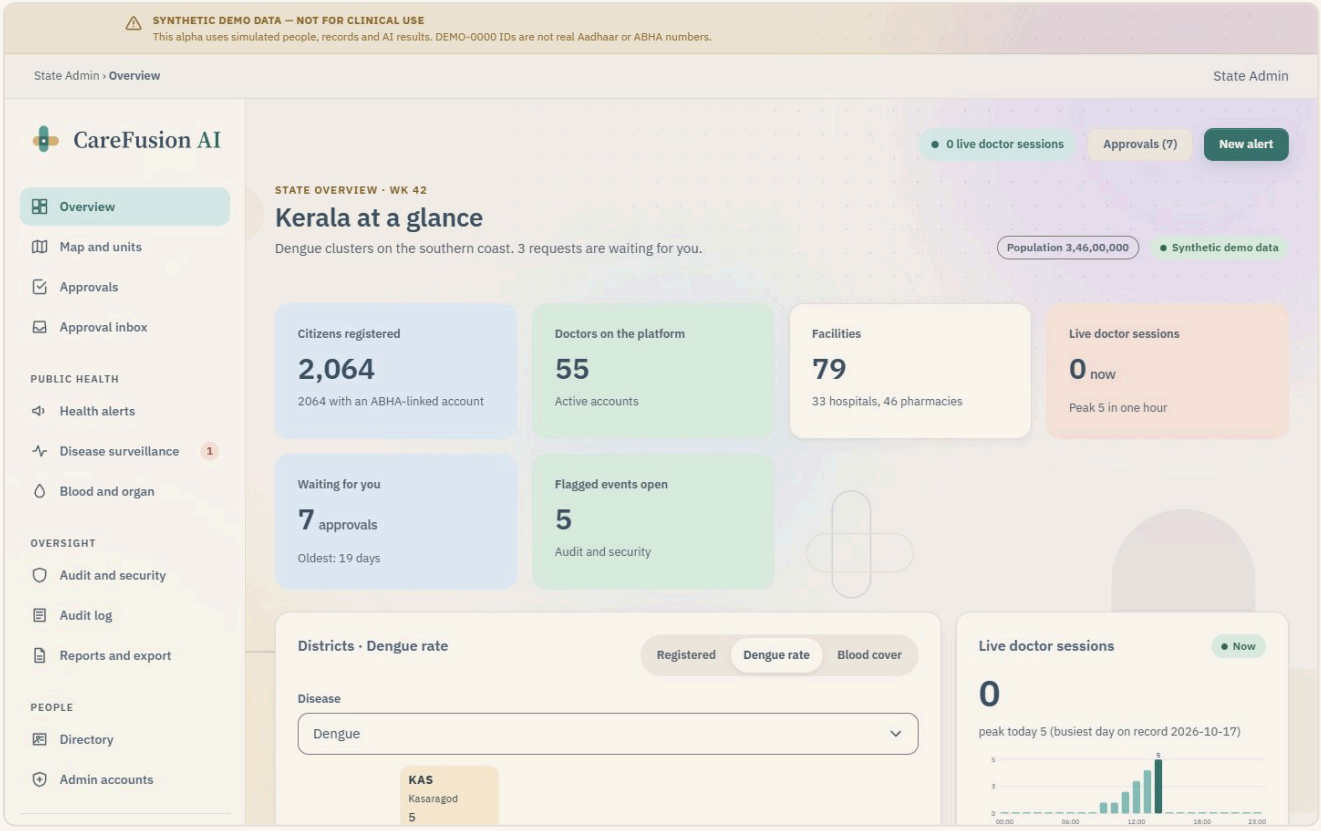

Screenshot of `/district-admin?section=approvals`

GOV-6

Look across the state

As a state admin, **I want** the same console for all of Kerala **so that** I compare districts and support the weakest.

- Same sections, with Kerala-wide totals and the 14 districts on the map.
- Approvals that district admins escalate arrive here.

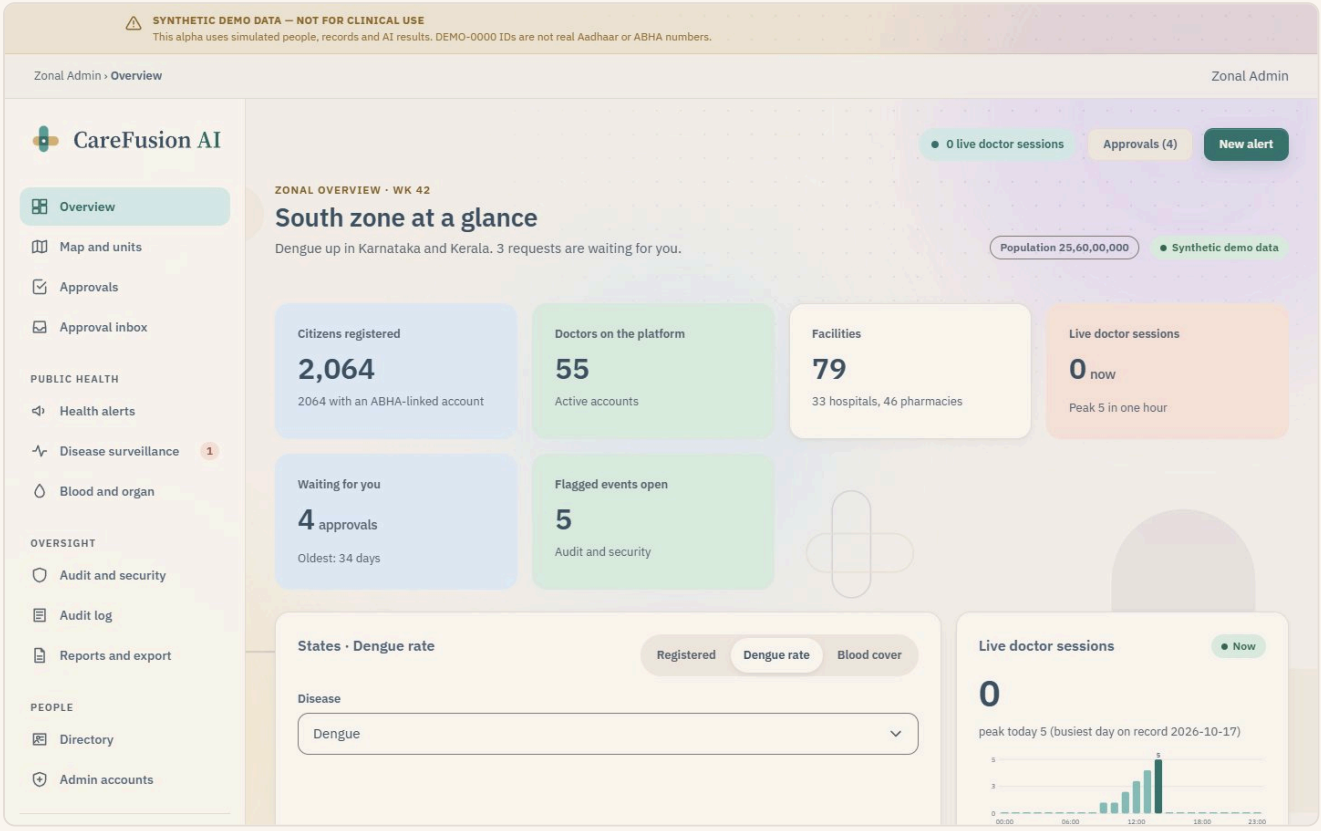

Screenshot of `/state-admin`

GOV-7

Coordinate a zone

As a zonal admin, **I want** the same console for the South zone **so that** states can be supported and compared.

- Zone-wide figures across its states.
- Zonal admins create and approve the next level down in the admin chain.

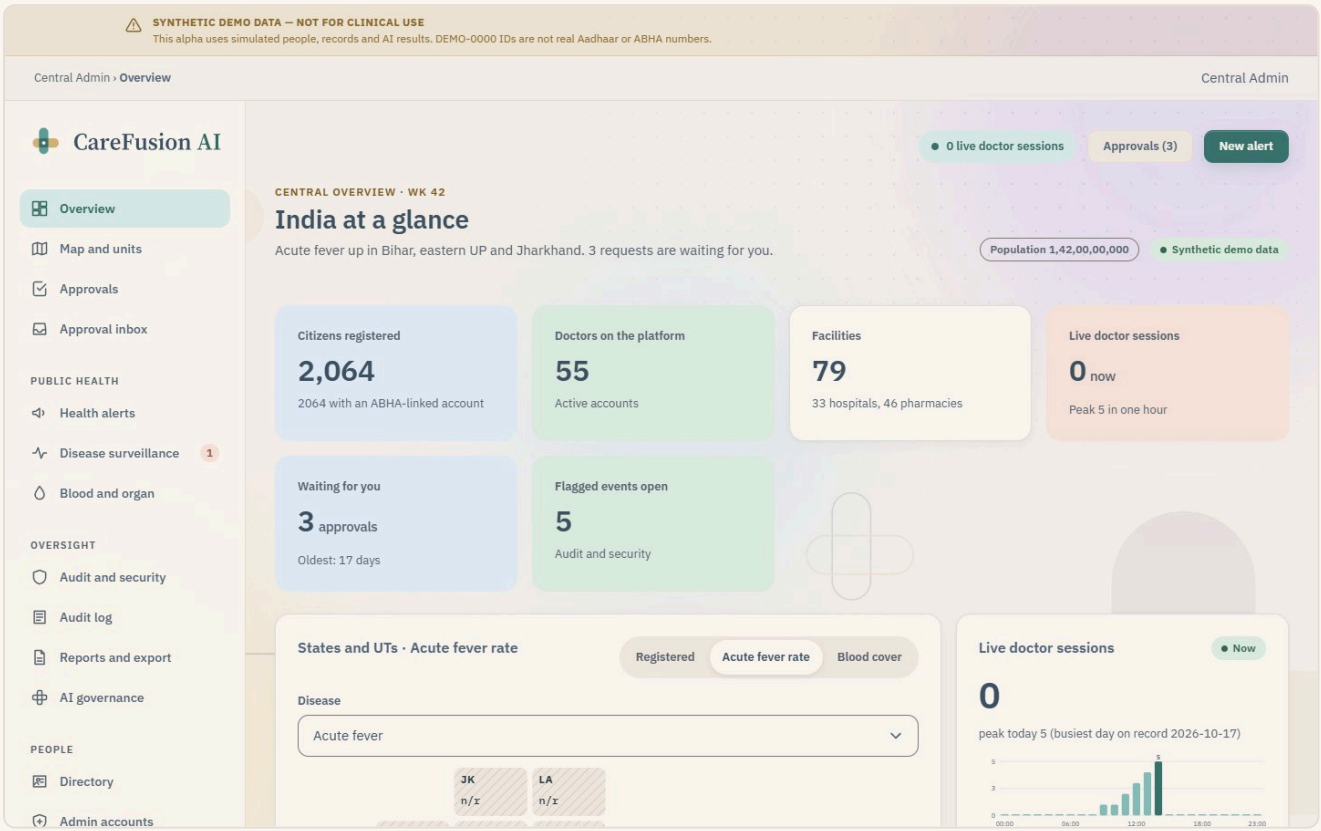

Screenshot of `/zonal-admin`

GOV-8

See the national picture

As a central admin, **I want** the national console, including blood and organ waiting lists and reports **so that** policy decisions rest on evidence.

- All 36 states and union territories on one map.
- De-identified CSV exports for six reports, with small numbers shown as "<5".
- Platform settings that change something big need a second central admin.

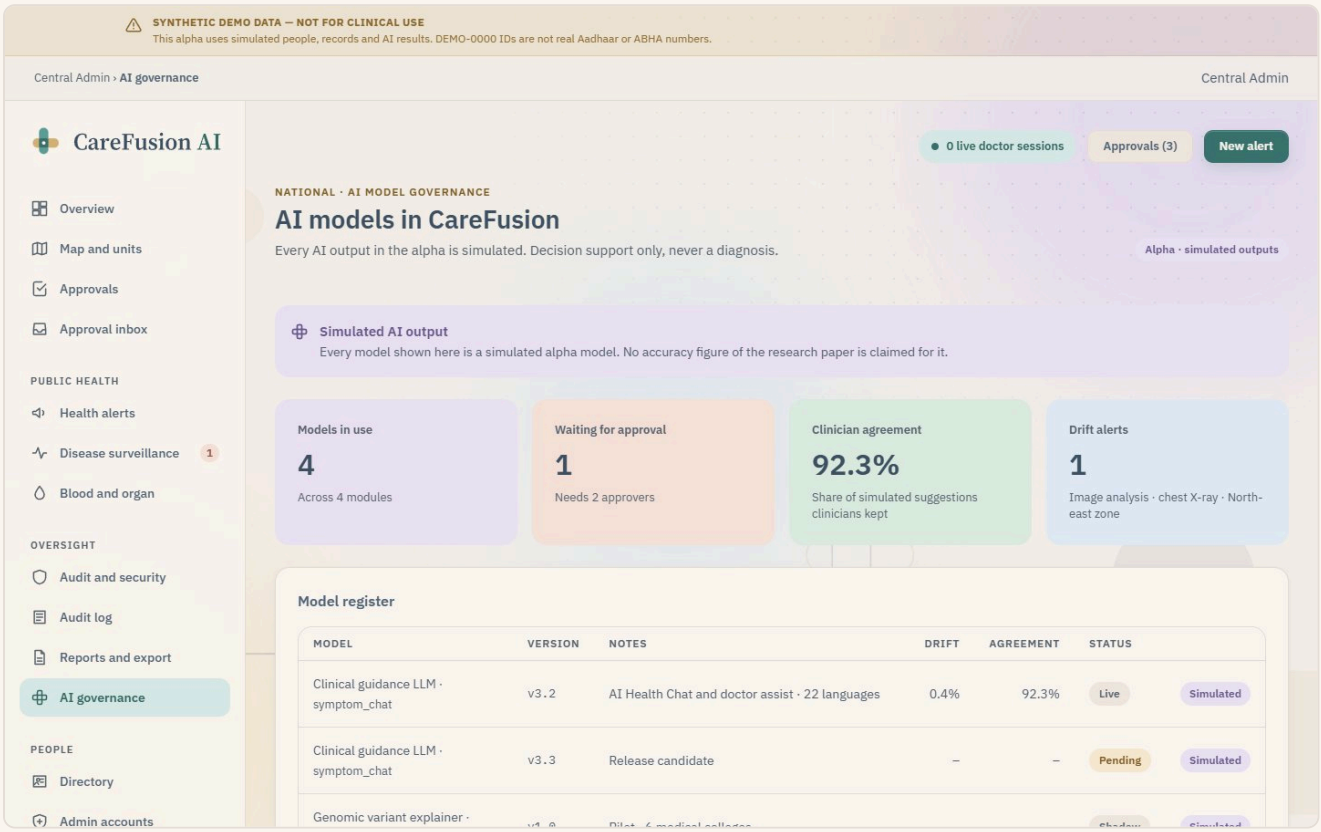

Screenshot of `/central-admin`

GOV-9

Govern the AI models

As a central admin, **I want** a register of AI models with drift monitoring and a release process **so that** unsafe models are caught and never go live alone.

- Model register with versions, agreement and drift over 12 weeks.
- A model that drifts more than 5 percent is held back automatically.
- A release needs two sign-offs. Clinicians can file safety reports.
- All alpha outputs are simulated and labelled as such. Only the central admin can open this section.

Demo script, status and next steps

Ten-minute demo script

Start at the demo launcher. Open two browser windows so you can watch one role act and another respond. Demo "today" is Saturday 17 October 2026.

1. **Public**
   Open the landing page, then the demo launcher at /demo-signin.
2. **Citizen (window A)**
   Sign in as Anjali. Look at the home page, then Share and access to see her rotating key.
3. **Doctor (window B)**
   Sign in as Dr. Nair. Open the patient with Anjali's key. Review a simulated AI hint.
4. **Doctor**
   Order a lab test and sign a prescription. Watch the alerts appear for Anjali in window A.
5. **Lab and pharmacy**
   Sign in as the lab technician and release a result. Sign in as the pharmacist, verify and dispense the prescription.
6. **Citizen**
   Back in window A, see "Ready to collect" in Medicines and Alerts.
7. **Hospital admin**
   Open Break-glass review and see the emergency access that needs a decision.
8. **Government**
   As District admin, open the map and surveillance, then try AI governance and see it refused. Switch to Central admin and open it.

Where things stand

Working today

- All 42 designed screens run against a real database and API.
- Twelve roles with their own workspaces and role-based access.
- Cross-role events: a booking, prescription or result shows up in the other roles' apps within seconds.
- Patient-controlled access with rotating key, sessions and emergency break-glass with review.
- Privacy rules in the database: a citizen never sees another patient's events, and government roles never see patient-level events.
- Realistic synthetic data for one demo day across hospitals, wards, labs, pharmacies and districts.

Known gaps in the alpha

- Staff and admin password login, password reset and staff activation are visual only. Demo sign-in is used instead.
- All AI output is simulated. No real model is connected.
- All government and messaging integrations are mock connectors. SMS, email and WhatsApp are not sent.
- File storage links in seeded documents are placeholders, so downloads of seed documents do not open a real file.
- Some "today" figures in the nurse and pharmacist apps use the real clock, so waiting times look very long against the October demo date.
- Block-level admins, front-desk and ASHA accounts, and teleconsult video are not built.
- Approving a hospital profile change does not yet update the hospital record.
- Automated tests cover the database rules. The new API and screens are tested by hand so far.

The technology, briefly

Front end	React 18, Vite, TypeScript and Tailwind, with the Soft Pastel Luxury design system (warm canvas, dusty teal, lavender for AI only).
API	NestJS on Node 22, raw SQL. Each request runs under row-level security as the signed-in person.
Database	PostgreSQL 16 with PostGIS. SQL migrations are the source of truth, with a migration ledger and deterministic seed files.
AI service	FastAPI (Python 3.12), simulated outputs in the alpha.
Identity	Keycloak for real logins. A demo mode lets reviewers enter any role.
Files and cache	S3-compatible storage (LocalStack on a laptop, Cloudflare R2 in the alpha), Valkey for short-lived state, Mailpit for test email.
Alpha hosting plan	Vercel for the web app, Oracle Always Free for the services, Neon for Postgres, Cloudflare R2 for files.
Repository	pnpm and Turborepo monorepo: apps/web, apps/api, apps/ai, packages/shared and carefusion-db.

Glossary

ABHA
Ayushman Bharat Health Account, the national health ID. Demo IDs look like DEMO-0000-1234.

HPR / HFR
Health Professionals Registry and Health Facility Registry. Both are mocked in the alpha.

Break-glass
Emergency access to a record without the patient's key. Always reasoned, time-limited, read-only and reviewed.

Rotating key
A code that changes every few seconds. A doctor uses it to open one patient for a limited session.

NEWS2
National Early Warning Score, a bedside score that flags a deteriorating patient.

FEFO
First expiry, first out. The pharmacy gives the batch that expires soonest.

Westgard rules
Statistical rules that decide whether a lab quality-control run is acceptable.

Small-cell rule
Counts below five are hidden so that a person cannot be identified from statistics.

RLS
Row-level security. The database itself decides which rows a person may read.

Simulated AI output
A clearly labelled stand-in for a future model. Never a diagnosis and never shown to citizens before a doctor reviews it.

All data in this guide is synthetic demo data. AI output shown is simulated. Government integrations are mock connectors.
